OVERTURNED CANDLE STARTS SMALL FIRE

Happened in Room at 34 Mill Street—Volumes of Smoke But Little Blaze.

A somewhat unique method of fighting fire was tried out with decided success last evening when a kettle of boiling water was used to quench the flames. Louis Urdang, who boards with A. Jacobson at 34 Mill Street, was one of the spectators of the blaze in Dock street. After witnessing the fire department in action, Mr. Urdang returned to his home and made his way up to his room on the third floor. The young man was somewhat startled and surprised to see smoke pouring down the stairs. He rushed up to his room and as he opened the door was almost suffocated by the outburst of smoke.

He seized the nearest vessel containing water at hand, which happened to be a kettle merrily singing on the stove, and rushed with it into an inner room where he found the whole room seemingly in flames. By means of the boiling water he succeeded in his efforts to quench the fire. After the smoke had cleared away a better idea of the damage could be ascertained and it was found that the fire which had been started by a candle left burning on the table had dropped to the table cloth and set it ablaze. The flames rapidly spread across the table and several chairs around it were badly charred. A trunk containing Mr. Uurdang's personal effects had a large hole burned through it, and the goods inside were also burned. The loss is covered by insurance.

How Much Tobacco Will My Heart Stand

A Question Vital to Every Man Who Smokes or Chews

IT MAY COST A PRECIOUS LIFE TO FIND OUT BY EXPERIMENT

New York: Doctor Connor, formerly of Johns Hopkins hospital, says: Many men who smoke, chew or snuff incessantly and who are seemingly healthy are suffering from progressive organic ailments. Thousands of them would never have been afflicted had it not been for the use of tobacco, and thousands would soon get well if they would only stop the use of tobacco. The chief habit forming principle of tobacco is nicotine, a deadly poison which, when absorbed by the system slowly affects the nerves, membranes, tissues and vital organs of the body. The harmful effect of tobacco varies and depends on circumstances. One will be afflicted with general debility, others with catarrh of the throat, indigestion, constipation, extreme nervousness, sleeplessness, loss of memory, lack of will power, mental confusion, etc. Others may suffer from heart disease, bronchial trouble, hardening of the arteries, tuberculosis, blindness or even cancer or the common affliction known as tobacco heart. If you use tobacco in any form you can easily detect the harmful effects by making the following simple tests. Read aloud one full page from a book. If, in the course of reading your voice becomes muffled, hoarse and indistinct, and you must frequently clear your throat, the chances are that your throat is affected by catarrh and it may be the beginning of more serious trouble. Next, in the morning before taking your usual smoke, walk up three flights of stair at a regular pace, then stop. If you find that you are out of breath, your heart beat is forced, trembling or irregular, you may be a victim of functional or organic heart trouble. If you feel that you must smoke, chew or snuff to quiet your nerves, you are a slave to the tobacco habit, and are positively poisoning yourself with the deadly drug, nicotine. In either case you have just two alternatives—keep on with the self-poisoning process irrespective of the dangers and suffer the consequences, or give up the habit and escape the dangers. You can overcome the craving and stop the habit in a very short time by using the following inexpensive formula. Go to any drug store and ask for Nicotol tablets, take one tablet after each meal, and in a comparatively short time you will have no desire for tobacco, the craving will have left you. With the nicotine poison out of your system your general health will quickly improve.

NOTE—When asked about Nicotol one of our leading druggists said: "It is truly a wonderful remedy for the tobacco habit; away ahead of anything we have ever sold before. We are authorized by the manufacturers to refund the money to every dissatisfied customer, and we would not permit the use of our name unless the remedy possessed unusual merit." Nicotol tablets are sold in this city under an iron-clad money-back guarantee by all up-to-date druggists.

TETE-A-GAUCHE TO SUPPLY THE NORTH SHORE WITH POWE

Water Power Commissio Find This Only Availabl Site With Storage Capacit —Will Give Manufacture of That Section Cheape Power.

The New Brunswick Water Powe Commission in its report to the Go ernment recommends that the Nort Shore, from Newcastle to Campbe ton, be supplied by a development o the Tete-a-gauche, that being the onl site available where the necessar storage capacity can be obtained.

The report is as follows:

"The third district under considere tion is the North Shore, from New castle and Chatham to Campbellton and the problem is to find a way i possible of supplying all these town with light and power from a centra plant. There is no possible powe site near Campbellton where powe could be developed at a cost in pro portion to the comparatively small re quirement of a town of this size. The only large stream on the North Shore that has any considerable power pos sibilities is the Nepisiguit, and this is now being developed by the Bathurst Lumber Company for ther own use in supplying power to operate their present and contemplated pulp and paper plant. After a careful study of this situation we were forced to the conclusion that the only available stream is the Tete-a-gauche, which rises between the head waters of the Nepisiguit and the Upsalquitch. It is a comparatively small stream draining about 100,000 acres, but it has two very important advantages:

"First, for the lower eight miles it flows through a narrow rock gorge with nearly perpendicular walls, and with an aggregate fall of 337 feet, which may be developed in four units as follows:

No. 1	105 feet
2	132 "
3	65 "
4	35 "
Total	337 feet

This with a regulated flow of 130 c. s. f. feet will develop 4,000 continuous or 9,600 ten-hour power.

"Second, the chance to create sufficient storage to regulate the flow above named all the year round. This is a prime necessity on all our streams, more particularly on the North Shore, where the precipitation is low and the bulk of it in the form of snow which creates flood conditions during a short period, after which the water runs off quickly, leaving the streams low for the greater part of the year, so unless we can impound enough water to largely supplement the ordinary flow, the stream would be of very little value for the production of power that must be maintained at a uniform rate all the year round.

"At a point about twenty miles from the mouth of the river and commanding at least two-thirds the drainage area, there is a narrow granite ridge through which the streams flow and where it is possible to build a dam that would impound 2,000,000,000 cubic feet of water, which would certainly regulate a flow of 130 c. s. f., even though the reservoir be required to furnish three-quarters of this amount for eight months of the year.

"The most difficult part of this problem is to get sufficient revenue to cover the heavy fixed charge against the first unit.

"The power requirement of the several towns at present does not exceed 800 h. p. or 600 kilowatts, and the average twenty-four hour load will not probably exceed forty per cent. of the peak or an aggregate of 2,100,000 kilowatt hours, which would mean a high rate as compared with other sections. With this possibility in view, the Chairman and Mr. Smith visited the different towns and satisfied themselves that the towns affected could pay a rate that would at least meet interest and operating costs at the outset and still make a considerable saving over their present cost. Fortunately it looks now as though there will be a demand for at least 1,400 h. p. for a pulp company near Newcastle, in which case the first unit can be worked to its utmost capacity and produce sufficient power to meet the fixed charge at normal rates. With this difficulty solved, having the expensive storage dam built and the transmission lines, the balance of the power can be developed and sold at lower rates."

They recommend the immediate development of the first unit, which will give 1,241 horse power continuous or 2,978 ten-hour; the estimated cost being $595,000, calling for a fixed charge of $65,000 per year.
