

“WALKER”

PATENT
RUBBER-FACED

FIRE HYDRANTS

HAVE PERFECT
WATER-TIGHT VALVES.

Perfect Water-tight Valve.

The Valve has a removable rubber face. Sediment between the valve faces will not scratch and cause leaks.

No Rubbing or Scraping Valve Faces.

This device is patented. Its action is positive.

There are two distinct motions of the valve in opening.

First, away from the seat horizontally, then down out of the water-way.

Motions are reversed when closing.

No More Bent Rods.

Inexperienced workmen cannot bend or twist the rod.

All strain on rod is tensile, between points in the valve only a few inches apart.

No Digging to Remove Valve and Waste.

Valve, rod and waste are all in one section.

A simple lift brings all parts out at the top.

Top cap, secured by three bolts, is easily removed.

Indestructible Waste Device.

Made of hard bronze; form of a ball joint.

No rubber or leather parts to cause trouble.

Cannot be damaged by sediment.

No Flooding from Broken Post.

When closed the valve is locked upon its seat.

This is a patented device.

Should the standpipe be broken by accident, hydrant still remains tight.

All top parts can be removed safely without shutting off water from the main.
