

WILSON'S PULMONARY CHERRY BALSAM

is superior to all other remedies for Coughs, Colds, Sore Throat, Asthma, Bronchitis, Influenza, Whooping Cough, Croup, Congestion and Inflammation of the Lungs, and in fact for all the ordinary *Diseases of the Chest and Lungs*. It relieves the inflammation quickly, causes a free raising or expectoration of phlegm, heals the raw soreness of the throat and pipes, while at the same time it allays the accompanying fever, strengthens the general system, and prevents the serious symptoms which are apt to follow a *neglected cold*.

All of the inflammatory diseases of the Pipes, Lungs and Throat, and air passages, differ from one another, not so much in kind as in intensity. They are all characterized by a very similar set of symptoms, only that in one, one group of symptoms are more prominent than in another. In all of them there is more or less difficulty of breathing, hoarseness, soreness of the throat and chest, cough more or less spasmodic, dry, or accompanied with an expectoration of tough, stringy phlegm, or greenish or bloody matter. In Asthma the difficulty in breathing, sometimes amounting to almost complete choking, is the prominent symptom, with but a limited amount of expectoration, and but little cough.

ST. JOHN, Dec. 20, 1876.

I have had the Asthma for a number of years, and at times have been very low. I was sixteen or seventeen years in various places trying all the medicines I could procure. I offered, during that time, physicians any reasonable sum that would undertake to cure me. After trying some experiments they all concluded it was too hard a case, and gave it up. From seeing some notice of WILSON'S PULMONARY CHERRY BALSAM, I determined to try it, and by the use of it found immediate relief and permanent benefit, as I have had no return of disease. T. A. ROBBINS.

HARVEY, Jan. 17, 1877.

Being severely afflicted with Influenza, a hard cough and asthma, and finding no relief in anything I could get—Consumption appeared inevitable, but by taking two forty cent bottles of WILSON'S PULMONARY CHERRY BALSAM, I was restored to perfect health. W. K. ARNOLD.

In Bronchitis, soreness of the throat, lameness in the chest, chiefly under the breast bone, and around it, a hacking cough, with expectoration of a tough, stringy phlegm, often tinged with blood, but frequently only greenish, are the prominent symptoms; but there is a good deal of oppression of breathing, especially in wet

weather, a weakness of the general system, which it is very hard to shake off, and sometimes a considerable amount of feverishness at nights, often accompanied by cold sweats. These are the cases which are especially apt to run into Consumption, and are just the cases in which WILSON'S PULMONARY CHERRY BALSAM produces the most admirable effects.

QUEBEC, Oct. 10, 1876.

My father has just recovered from one of the most severe attacks of Bronchitis ever known in this place, and so acknowledged by all who saw him. His physician, who is an able practitioner, considered his case hopeless, and beyond recovery. I induced him, knowing from past experience its virtues, to try WILSON'S PULMONARY CHERRY BALSAM, and the effect was astonishing. His case was alarming, and a description of it would almost challenge belief. I was with him night and day and watched the progress of the disease and the effect of the CHERRY BALSAM, which worked like a charm. I could challenge the world to produce a medicine that would have so good an effect. T. T. BACKER.

Influenza is noted especially as being a spasmodic, that is a great many persons in a community are affected by it at the same time. It is characterized by sneezing, coughing, rawness of the throat and air passages, with a profuse running at the nose, and an equally profuse expectoration of an acrid phlegm, which excoiates the nose openings, making them raw and red, to the great annoyance of the sufferers.

Whooping Cough is a very distressing complaint, chiefly among children, and is known by its convulsive cough, accompanied by long drawn out *whoops*. The little sufferers will be noticed frequently to leave their play, which occupies them during the intervals, and catch hold of something to support themselves by, while strangling, and then cough till they turn black or blue in the face and hands, at last bringing up a greater or less quantity of this phlegm, often bloody in streaks or spots.

Croup is a disease of children, scarcely ever known to occur with an adult, but it is very fatal before nine years of age. The patient generally wakes up suddenly in the night, with a prolonged choking cough, accompanied by a crowing sound, and imminent signs of suffocation.

Congestion and Inflammation of the Lungs, or Lung Fever, are all different stages of the same disease. It almost always comes from a sudden cold, which causes a filling up of the air vessels of the Lungs
