> GIRL'S DRESS. By Anabel Worthington.

It is surprising how the addition of a few little finishiry touches, such as a new ollar or belt, can entirely change the appearance of a dress, but you have proof of this fact in No. 8666. The dress is a very simple model, with a plain waist buttonng at the back and having a one piece skirt eathered to it. The neck of the dress may be in high or V neck style. With the former a straight standing collar is used, but the low neck with the big collar is very much more stylish. The ends cross band of the material. The long sleeves are gathered into straight cuffs. Machine itching makes the only trimming.

The girl's dress pattern No. 8666 is cut in five sizes 6 to 14 years. As on the figure, the 8 year size requires 3% yards 27 inch or 2% yards 36 inch material.

To Obtain This Pattern Send 15c to The Courier Office, or two for 25c.

HAS NOT PROVED AN EFFECTIVE WAR WEAPON.

Short Range and the Effect Is Not Lasting—British Officer Gives an Account of One Form of German Frightfulness That Has Been a Complete Failure.

frightfulness, none of the new ing success than the use of liquid fire, observes Major S. M. J. Auld in the World's Work. But the first horror once over, a horror due to the undoubtedly terrible appearance of the new weapon and the utter surbeen found to have little destructive value, as is proved by the fact that the Allies have provided no special form of cover for the men as protec-tion. In describing the first acquaint-ance of the British troops with the "flammenwerfer," or "flame-throw-

er," Major Auld writes that-

"At 8.20 a.m. on the morning of July 20, and without the slightest warning, the front line troops were enveloped in flames. Where the flames came from could not be seen. All that the men knew was that they seemed surrounded by flerce curling flames which were accompanied by a loud roaring noise and dense clouds of black smoke. Here and there a big blob of burning oil would fall into a trench or a saphead. Shouts and yells rent the air as individual men, rising up in the trenches or attempting to move in the open, felt

the force of the flames.

"The only way to safety appeared to be to the rear. This direction the men that were left took. For a short space the flames pursued them, and the local retirement became a local rout. Then the flames stopped and the machine guns began to take toll of the fugitives. Only one man from the front trenches is known to have returned. German infantry, following up, poured into the breach in the line, widened it, took our positions as far back as Sanctuary Wood, and

then consolidated. "Then days afterward we counter attacked and won back the whole of the line concerned, but at very considerable cost. Incidentally, we captured two of the German flame pro-jectors, one of them complete, and hey proved to be of the greatest pos-

peculiar-shaped nozzle.
"On examination it was found that the body of the projector was divided internally into two compartments which could be connected by opening another tap. The upper compart-ment was the compressor and the lower the oil reservoir. The com-pressor chamber was filled to a level pressure of 23 atmosphere with de-oxygenated air or nitrogen. Air itself cannot be used because of its oxygen content forming an explosive mixture with the vapors from the oil, and any with the vapors from the oil, and any heating or compression or back-flash from the flame or fuse might make things very unpleasant for the operator. The nitrogen required for the flame projectors is carried into the field in large cylinders about four feet six inches in length and six inches in diameter. Several of these cylinders have been captured from the enemy since. These cylinders are actually taken into the trenches and the flame projectors charged from

ingenious part of the whole contri-vance, and is so made that the oil ig-nites spontaneously the minute the jet is turned on, and is kept alight by a fiercely burning mixture which lasts throughout the discharge.

"The nozzle is about nine inches long and detachable, so that replacein paraffin wax and fitting loosely into a thin brass case. When the nozzle is in position all that is necessary is to turn on the tap, and the stream of flame issues from the tube and can be directed at will.

Children Ory

been found so ineffective in trench warfare. "The most essential part of the tactics and the most difficult thing to do is to get near enough the target to make the shot effective,

the target to make the shot effective, and the range is only fifty or sixty feet," he asserts. And further:

"The attackers suffer from two such severe disadvantages that against well disciplined troops they stand little chance. These disadvantages are (1) the flammen verfer carriers have to get so near their objective that they are almost certain to be shot, and they then become a source of danger to their own side:

(2) men in trenches know they are perfectly safe from frontal flame attack if they keep well down and hug N regard to the German policy of tack if they keep well down and hug the parapet side of the trench. The reason for this is that the flame will not sink down into a trench, but hav-ing little force behind it at the end of its journey is curled upward by the rising currents of hot air. The result is that any sort of head cover (unless made of wood) makes per-fect protection, and a man crouching prise of those attacked, liquid fire has in a trench or even lying prone in a shell hole is very unlikely to be more than slightly scorched at the very worst. I can vouch for this, for I have lain at the bottom of a trench with the flames playing over my head and have not been injured in the slightest, though I confess to be-ing very much relieved when the flame stopped. The only danger in trenches to men who keep their heads is that of 'blobs' of burning oil falling from the end of the flery stream, but this is not a very serious

"Another serious disability in the German liquid fire is its very short duration. The stream of flame from the portable flammenwerfer lasts rather less than one minue. It is im-possible to charge up again on the spot, and the result is that once the flame stops the whole game is finished and the operators are at our mercy. Without making the appar-atus of a prohibitive weight the dur-

atus of a prohibitive weight the duration of the flame cannot be increased. Even the heavy projectors give only a flame lasting at the best one minute and a quarter.

"It must be realized that it is discipline and coolness (if one may use the word) which count, and that the moral effect on unsteady troops, unseed the fact that the appalling aware of the fact that the appalling flames have little destructive value, may be very great indeed. When men have bolted from the trenches into the open they are an easy prey.

With the entrance of the Japane rs, one of them complete, and proved to be of the greatest posuse to us subsequently for edumap of Siberia. And it is a very cating the army in the new warfare and for inspection by our own experts with a view to their duplication for retaliation.

"The flame projectors taken by the large that a gain or loss of a single interesting in construction. The main part was a cylindrical vessel of steel, about two feet in height and fifteen linches in illameter, provided with straps so that it could be carried on a man's back. At one side about two-thirds of the way up was a filling hole for oil closed by a serew cap. Near the top was a pressure gauge attachment, and toward the base was a lock closed by a lever handle and to which could be eattached a long length of flexible hose ending in a peculiar-shaped nozzle.

Canadian newspaper readers — the map of Siberia. And it is a very different map from any which the war had it is a very different map from any which the war had it is a very different map from any which the war had it is a very limiter to made familiar. France we have been depicted upon a scale so large that a gain or loss of a single was visible. A great battle, like that of the Somme, may have not advanced the line more than ten first and vanced the line more than ten first had not carry the Germans forward as far as from Toronto to Brantford.

In Siberia there is a different story to tell. There is a Siberian Government once had a sort of outpost of the first, at Vladivostok. But between these two cities lie 2,386 miles of rall, a distance for a large of the snowy day with rapture and applause: for I am peculiar-shaped nozzle.

On examination it was found that

Railroad east of Omsk, and from that city to Krasnoyarsk, the town farthest away, the distance is 854 miles, or about as far as from New York to Savannah. But this is only one-quarter of the breadth of Siberia, from the mountain slopes that sever it from Russia to the Sea of Japan.

Most populous of the Siberian provinces is that of Tomsk, where anti-Bolshevist forces prevail. This province has an area of 327,173 province has an area of 327,173 quare miles, rather more than once cylinders have been captured from the enemy since. These cylinders are actually taken into the trenches and the flame projectors charged from them there.

"The combustible liquid used in "The combustible liquid used in the flame throward has varied in the size of an France, yet it is one of the smaller Siberian divisions. For the total area of Siberia is 3,785,000 square miles greater than all Continental, United States and Alaska as well, huge enough to make six Mexicos and have a little

"The combustible liquid used in the flame-throwers has varied in source and composition from time to time, but it invariably has one characteristic which appears to be essential for good results—it must have light or easily volatile and heavy and less volatile fractions mixed in carefully graded proportions. The heavy oil has sometimes been a petroleum product and sometimes a tarry residual oil from the distiliation of wood. The light portion that insures the jet's keeping alight was originally a light gasoline, but at one period, whether from shortage of petrol or not I do not know, the place of the latter in the mixture was taken by ordinary commercial ether.

"The lighting device fixed at the end of the flexible hose is the most ingenious part of the whole contrivance, and is so made that the oil ignites spontaneously the minute the nites spontaneously the minute the light in the sound wave in the part of the lightning's path that is nearest to us reaches us first, and that from other parts of the path afterward, according to their distance. Intermittent into their distance. Intermittent in the mixture was taken by ordinary commercial ether.

"The lighting device fixed at the end of the flexible hose is the most ingenious part of the whole contrivance, and is so made that the oil ignites spontaneously the minute the
