STEAM BRUSH FACTORY

NOW MANUFACTURING

OKATKA PAINT, OKATKA WHITEWASH, PASTE, LEATHER HORSE, and all descriptions of PAINT WHITEWASH, and SCRUB BRUSHES,

FACTORY and OFFICE, Union corner Carmarthen Street,

june 5 ST. JOHN, N. B. JOHN MURPHY.

PROSPECTUS

OF THE

SPRING HILL MINING COMPANY,

INCORPORATED UNDER LAWS OF NOVA SCOTIA, 1870, C. 72.

Capital $400,000, with power to increase to $1,000,000.

SHARES $50.

LIABILITY OF SHAREHOLDERS LIMITED TO THE AMOUNT REMAINING UNPAID ON THEIR STOCK.

2,600 Shares are offered by public subscription. $5 per share to be paid on application; $15 per share on allotment, 1st July, 1872; $15 per share on 1st September, 1872, and $15 on 1st November, 1872; or the whole may be paid on allotment, with deduction of interest at 6 per cent. per annum, on all payments in anticipation of the date when they become due.

DIRECTORS, &c.

HON. ALEXANDER MACFARLANE, Senator, Wallace, Nova Scotia, President.
HON. ROBERT BARRY DICKEY, Senator, Amherst, N. S.
CHARLES H. M. BLACK, Esq., Merchant, Halifax, N. S.
LT. COL. CHARLES J. STEWART, Amherst, N. S.
ALEXANDER ROBB, Esq., Proprietor Amherst Iron Foundry, Amherst, N. S.
TREASURER—JAMES S. HICKMAN, Esq., J. S. Hickman & Co., Merchants, Amherst, N. S.
SECRETARY—WM. J. MOFFAT, Esq., Barrister, Amherst, N. S.
BANKERS—Bank of Nova Scotia, Amherst Branch; and Bank of New Brunswick, St. John, N. B.
OFFICE—Mr. W. J. MOFFATS Office, Amherst, N. S.

The Company have acquired, by purchase, three leases from Government of Nova Scotia to Hon. Alex. Macfarlane, of one square mile each, of the richest coal deposits in Canada, at Spring Hill, Cumberland County, Nova Scotia, renewable until August, 1926. Royalty 10 cents per ton of 2,240 lbs.

Five seams and upwards, of varying thickness from 2½ to 13 feet, are known to exist within these areas, which comprehend (exclusive of a portion of the General Mining Association reserve) nearly all the coal yet discovered in this well known district. Of these, one, known as the 11 feet seam, has been opened, and several hundred tons raised by a slope sunk only 25 feet from the surface, and has been proved by test pits about 1½ mile at an average of 10 feet from the surface, and preserving a thickness of 10 feet for two-thirds of that distance. The slope has lately been carried down to the depth of 95 feet, exhibiting a marked improvement in the quality of the coal, described by Sir Wm. Logan, from specimens near the outcrop, as "an excellent coal, superior to any of this continent yet known." A moderate estimate of the quantity would give as the yield from this seam alone, half a million tons annually during the lease. The larger seam has been exposed by a trial pit within the areas; the smallest of 2½ feet, is believed to contain a valuable gas coal, and it is a fair geological inference that all these beds of coal will be found in their proper position. Thus several distinct collieries may be leased to individuals or companies.

A branch railway of 3½ miles has been surveyed, and steps are being taken for its construction to connect the property by a down grade with the Intercolonial Railway, at a point 21 miles from the head of the Bay Fundy and contemplated Bay Verte Canal, and 13 miles from a shipping place at the mouth of Maccan River, half a mile from the Intercolonial, where vessels drawing 13 feet of water may load. Until the opening of the Intercolonial, between Truro and Amherst, next autumn, the coal will be hauled 4 miles to Black River Station.

From the nearness of the outcrop to the surface, and the seams lying on high and descending ground, securing easy drainage, it is considered that these seams may be most economically worked.

The freight of a ton from the head of Bay Fundy to Boston or New York is about 75 cents less than from Pictou or Sydney—of itself a good profit, while the difference to St. John is fully $1 00.

The Spring Hill coal is well adapted for house, steam and smelting purposes. Situated within 37 miles by rail of the lodes of brown hematite and micaceous iron ore of the richest quality, known as the Acadia iron ore, of Londonderry, it is difficult to assign limits to the quantity of ore likely to be taken to Spring Hill, for smelting by a coal unusually free from sulphur. The large proportion of carbon renders it eminently adapted for manufacturing coke, which, with the coal itself, must be extensively used in the iron and steel works at Londonderry, as well as the Machine shops being erected for the Government railways at Moncton.

The portion of the Intercolonial between Truro and Amherst is now being ballasted with engines driven by Spring Hill coal. It is understood that the line between Truro and Newcastle, if not the whole line to St. John, a distance of 280, miles will shortly be worked in the same way, and the local demand between these points, already large, is steadily increasing.

Vessels bringing flour from the St. Lawrence to St. John, Yarmouth, and other lower ports, through the Bay Verte Canal, when completed, may have return cargoes of coal to Quebec, Montreal or Toronto.

From all these sources of traffic, in addition to the Western part of Nova Scotia, the New England ports and New York, it is assumed that an unlimited market will be afforded.

Additional means of shipment will be afforded by the contemplated railway to Parrsboro—a port open at least ten to eleven months in the year—for which the Nova Scotia Legislature have provided large subventions.

The estimated cost per ton for raising, handling, and putting on board ship, say at mouth of Maccan river, is about as follows:

Cutting and raising, including weighing, screening, &c.	65 cents.
Railway transportation, loading and royalty	45
Cost on board	$1.10
Freight to St. John	1.20
Cost	$2.30
Average price of coal, St. John, wholesale	3.35

If Pictou and Sydney coal can be shipped to Boston and New York at paying prices, it cannot fail to be highly remunerative to send a better article from Spring Hill, with an advantage of 75 cents in freight. The local traffic would yield a high rate of profit.

Taking the low average of only 80 cents per ton, inclusive of repairs of machinery, &c., and assuming only 100 000 tons as the annual production at first, we have a gain of 20 per cent. on the capital, which might be much augmented by the rent of other seams, as suggested. From the exceptionally high character of this coal, and the facilities for raising it cheaply, this quantity, it is confidently believed, might ere long be doubled or trebled, and a large rate of profit secured even with considerable increase of capital.

TESTIMONIALS.

Extracts from Reports of Messrs. Woodhouse and Jeffcock, Mining Engineers, London and Derby, G. B., (January 2, 1866)

The Coal Field which we have carefully examined, and which is the subject of this Report, is situate in the county of Cumberland, in the province of Nova Scotia. It is generally described as the "Springhill" Coal Field, but in reality it is a part of the great Cumberland Coal Field.

The first or upper seam we found to be a bed of remarkably good coal presenting a very clean, compact appearance in its immediate outcrop. The section of the seam of coal was as follows:—

	Ft.	In.
Top Coal, (very good for roof)	1	6
Dirt	1	0
Good Coal	11	0
	13	6

This may be considered a very valuable seam of coal. The quality of the coal is exceedingly good. It may be described as a bituminous coal, but of dense and strong structure.

About 45 yards below the main seam we proved (by sinking a small shaft) another seam of about 3 feet thick, of good workable coal, having the same dip and angle as the main seam.

At a probable depth of 150 yards there appears to be a third seam of good coal, about 2 feet thick. This has been partially worked, and proved to be very good, considering it was near the basset.

The main seam of coal at Springhill will afford suitable fuel for smelting the iron—not containing an excess of ash, and free from sulphur. The physical characteristics of the coal are, its cubical, clean fracture, freedom from "bat" and dirt, often associated in the seam, and a density and strength of structure which suits either for coking, or, we think, for use raw in the blast furnace.

Extracts from Report, in 1869, of the late Mr. Ed. Hartley, F. G. S., of the Canadian Geological Survey.

The samples of coal examined were taken from the main seam of the Springhill coal field. An examination of the external character of this coal shows it to be a bituminous coal of a moderately compact texture, and not inclined to fall to pieces, or slack. Four samples were taken for analysis. I. and II. were two averages of the whole box: III. was a picked sample of the best (most compact) coal; and IV was a specimen of the coal showing a shaly texture. The results of proximate analysis in the laboratory were as follows:—

	I.	II.	III	IV.
Hygroscopic Moisture	1.21	.88	.58	1.28
Volatile combustible matter	35.08	35.52	33.27	35.03
Fixed carbon	61.49	59.62	63.85	58.53
Ash (perfectly white)	4.22	4.08	2.30	4.16
	100.00	100.00	100.00	100.00
Coke	65.71	63.50	66.15	63.06

Total amount of sulphur in coal, 0.225 per cent.

The analysis shows this coal to belong to the class known as highly bituminous, or fat caking coals, in character very similar to those of the North of England, known as North Country or Newcastle Hartley Coal. The high rate of volatile to fixed combustible matter should render this coal, in common with the Newcastle coals which it resembles, an admirable gas coal, while in the amount of sulphur it falls much below the average of Newcastle coals (which contain about nine-tenths of one per cent. as determined by the Admiralty steam trials); therefore the gas obtained from it should be very easily purified. The coke of this coal appears in every way adapted for iron smelting. (*See Canadian Geological Survey Report*, 1870.)

In forwarding Mr. Hartley's analysis, Sir W. E. Logan writes, 9th June, 1869: "You will observe that it is superior to any of this continent yet known. It is superior, too, to the average of Newcastle coals, and very nearly equal to the best."

Extract from Report of John Rutherford, Esq., M. E., late Inspector of Mines, Nova Scotia.

The 13 feet seam dips to the North-west at an angle of 25 degrees. It is underlaid at a depth of about 350 feet by one of 11 feet three inches thick (the main seam), the quality of which is also of a high character. South of the crop of this last, crops of three others have been found, the position of which is comformable to the largest seams.

Certificate from the Engineer of the Steamer "City of St. John," who burnt on that steamer one car load of the Coal, on 21st December, 1871.

The Springhill coal burns with but little intumescence, and does not agglutinate. It allows a free passage to the air, and gives a brilliant flame with a light smoke. It ignites easily and has but little tendency to soil, and does not crumble into powder when broken. Its clinker is friable, easily broken, and has but little tendency to adhere to the grate. For steamboat coal, I consider it superior to any Province Coal brought to market.

JOHN ROSS,
Engineer Str. City of St. John.

Professor Henry Y. Hind, M. A., in his recent Report of Springhill Coal Field, thus sums up: "Thickness of large Springhill seams 13 feet and 10 feet 3 inches. Quality of Springhill seams of the very first class. Distance of these from Parrsboro by rail, 28 miles. Known outcrop of Springhill main seam, 11 feet, on which operations could be immediately commenced, about 2 miles.

"The main seam, or what is supposed to be the main seam, has been traced for a distance exceeding one mile and a half in a northerly direction, on the Macfarlane areas."

In Professor Selwyn's, F. G. S., Report laid before Parliament, Session 1872, he thus refers to Mr. Scott Barlow's operations at Springhill: "The evidence, so far as it goes, appears to show that in a distance of about eight hundred yards, horizontal measurement, across the strike of the measures, there are eight seams of workable thickness, as under, in descending order. No. 1, 13 ft. 6 in.; No. 2, 6 ft.; No. 3, 2 ft. 4 in.; No. 4, 12 ft. 3 in.; No. 5, 2 ft. 6 in.; No. 6, a crop, thickness uncertain; No. 7, 4 ft., shaly coal; No. 8, 2 ft.; Total, 42 ft. 7 in."

APPLICATIONS FOR SHARES must be made in the annexed form, and forwarded to the Bankers, or to the Secretary at the Company's Office, where the By-Laws may be seen.

Dated 12th June, 1872.

FORM OF APPLICATION.

To the Directors of the Springhill Mining Company:

Gentlemen,—Having paid to the credit of the Company at your Bankers in the sum of shares of $50 being five dollars per share on my application for each, of said Company. I request you to allot me that or any less number of shares, and I agree to accept the same and to pay the sums due thereon in terms of the prospectus, dated 12th June, 1872.

Name.....
Address.....
Date.....

(Addition to be signed by applicant desiring to pay all the instalments on allotment.)

I desire to pay up my subscription in full on allotment, with deduction of interest at 6 per cent per annum on all payments in anticipation of the time they become due.

☞ Persons wishing to subscribe for Stock in the above Company, or those desiring further information respecting the property, will please apply, by letter or in person, to

E. N. SHARP,

At No. 23 Prince William Street.
