"NONPAREIL"

Billiard Hall!

SHARKEY'S BUILDING,

OPP. OFFICERS' BARRACKS, QUEEN ST.,

FREDERICTON, N. B.

T. E. FOSTER, - Proprietor

THIS HALL has been newly fitted up and handsomely furnished, and for room, light, ventilation and neatness, compares most favorably with any Billiard Hall in the Dominion. The Billiard and Pool Tables are pronounced by players to be superior to any now in use in this Province. They are the BRILLIANT NOVELTY, size, 4½ x 9 feet.

The main object in the construction of the Brilliant Novelty, and the one most noticeble, is that it embodies all the more salient or most important features that have rendered popular all the other styles of tables of The J. M. Brunswick & Balke Co.'s make. The Billiant Novelty has all the advantages and good points, including the respective inlays claimed by the "Nonpareil" and "Exposition," "Novelty," "Acme" and "Amaranth" Tables. The "Brilliant" is a happy combination of all those celebrated tables, and has rapidly taken the foremost place in the estimation of all players of Billiard and Pool Tables. The "Novelty" is finished and handsomely inlaid in many different colors, made up from California Laurel, Burl Ash, French Walnut, Birds Eye Maple, Mahogany, Rose Wood, Tulip Wood and Ebony. It is supplied with the finest of Vermont Slate bed, Simonis Cloth, and a first-class outfit of everything necessary.

A call is respectfully solicited from lovers of the game.

Boys under sixteen not allowed in the Hall.

Temperance drinks of all kinds, Cigars, etc.

T. E. FOSTER,
Proprietor.

MUNICIPALITY OF YORK.

Itching Piles---Symptoms and Cure.

The symptoms are moisture like perspiration. intense itching, increased by scratching, very distressing, particularly at night; seems as if pim-worms were crawling in and about the rectum; the private parts are sometimes affected. If allowed to continue very serious results may follow. "SWAYNE'S OINTMENT" is a pleasant, sure cure. Also, for Tetter, Itch, Salt-Rheum, Scald-Head Erysipelas, Barber's Itch, Blotches, all scaly, crusty Skin diseases. Box, by mail, 50 cts. 3 for $1.25. Address, DR. SWAYNE & SON, Phila., Pa. Sold by druggists.

Poultry Keeping for Profit.

Cleanliness is the best remedy for all insect vermin. Insects of this class breed in filth. Lice and the red mites harbour in the gathered manure and hide in the crevice of the roosts and nests. Their cast-off coats may be seen like a grayish mold upon neglected houses, all over the roosts and in the corners of the buildings. Here, too, the blood-thirsty red mite hide during the day, to rally around the fowls at night and torment them past endurance. At times the wretched fowls may be found humped up in a corner, slowly drained of their life blood by these miserable pest. No flock can thrive when left to suffer from them.

And yet it is remarkably easy to free a house and a flock from them. Remove their hiding places and they seem to abandon the premises, or otherwise the fowls are able to free themselves from their tormentors. It is this that makes it peremptory to have no doors, no crevices, cleats, pathes, or finictl ornamental nests and other worse than useless trappings about a poultry house. A smooth, even interior, covered twice a year with hot lime wash, with plain perches hinged to the scantlings at the rear, so that they can be raised to the walls at once, as has been previously described, is the very best arrangement possible. Then a weekly cleaning of the house with a can of kerosene oil and a barrel of lime left to air-slack slowly in a corner of the shed, will secure perfect freedom from these vermin. The clean house affords no harbours; the kerosene poured at the weekly cleaning on the hedges and joints of the roosts, and a liberal dusting with the fine lime dust, complete the business. After learning how to get rid of them the fowls can be handled and one can visit the house and explore the nests with comfort.

The so-called scabby legs is caused by a scab mite precisely like that which causes scab in sheep. Kerosene oil and lard applied with a stiff brush, and forced under the scales and scabs is a sure remedy. The scabs soon peel off and the legs become clean. Dressing the perches the lard (or oil) and kerosene mixture also prevents or cures this trouble if it is continued regularly. The fine lime dust spread in the evening, when the fowls are at roost, and which is breathed and makes the fowls cough and sneeze, destroys the throat thread worm, the cause of gapes in chickens. The frequent removal of the droppings is also a sure preventive, and where gapes prevail this should be done every morning and the manure removed to the garden and spread or dug in at once.

Bone Spavin.

A correspondent wants to know where bone spavin is located how long it takes to mature, its effect upon horses and its cure. A bone spavin usually makes its apearance on the inner and lower part of the hock. It may, however, assume a slightly differnnt position in different animal when it is given another name. Sometimes spavins will cause an animal to go lame, when they are quite imperceptible to the inexperienced, while at other times they will assume a very large size before giving any inconvenience. The victim first shows a desire to rest the heel of the foot of the opposite side upon the front wall of the opposite side while standing, and when moved will go upon the toe, and limp for a few steps. Then he will appear all right until allowed to stand a few minutes, when it will become stiff. As the trouble developes the animal will become permanently lame. If treated early a large number of spavins respond, and cures are effected, but if allowed to run the chances of a cure grow less as time passes. A spavin may, and often does, exist for ten and sometimes twenty months without causing lameness. The only reliable treatment is firing, but in mild cases, before the trouble has been too deeply-seated, the following very often brings relief:—Bathe or foment with cold water for two weeks, which reduces the inflammation. Follow this with a cantharadine blister, which may be repeated once or twice at intervals of two or three weeks. A seton passed in over the enlargement, and kept in for four or five weeks, with daily dressing, is sometimes very effectual in removing the lameness.

Food and Cough in Pigs.

Food has much more to do with coughing than people generally believe or suspect. Other things being equal, coughing is more common among hogs fed on corn, or, indeed on any dry feed, than it is among those which are fed on fresh-growing grass or other soft food, as boiled potatoes, boiled corn, or pumpkins or turnips. Hogs fed on dry meal or bran or shorts, cough more than if fed on shelled corn. But the trouble to which we now refer comes from the peculiar effect of corn as a feed. It is heating and stimulating; it is oily and fatty, and has a tendency to clog internal passages by fatty secretions; and although it seems strange that the lungs should be affected, or that the air passages should be disturbed, or that the breathing apparatus should be disordered by these accumulations of fat on the intestinal surfaces, yet it is true. Every very fat animal is more or less affected in its breathing; and if the extra fat is produced by corn its effect on the breathing is greater than if it is produced by a different kind of food something not so fatty or stimulating, as oats or peas, for instance.

In connection with this, too, may be considered the matter of exercise and condition of sleeping quarters. If an animal has plenty of room to exercise in fresh air, is kept clean and free from dust, mould, and similar disturbing elements, it will be less liable to respiratory affections than if it is closely housed and pushed ahead with corn and water.—*Kas. Farmer.*

The Poultry Yard.

Fowls cooped up all winter in a house poorly ventilated will not lay eggs that will hatch, and will lay but few eggs. It is absolutely necessary that they go into the open air, or that the houses be thoroughly aired each day, if we would have health and early broods of chickens. Sulphur must be fed once or twice a week, and clover hay fed.

If your houses have not been white-washed this season, do it at once. But first smudge the houses faithfully by mixing carbolic acid, turpentine and sulphur and firing the same, confining the smoke for two hours. Then air and whitewash, and you will save the fowls from the liability of lice, save feed, get more eggs, and have a clear conscience of duty done to your stock.

A correspondent of an exchange says:—"I have never had the least injury occur to my fowls, in consequence of anointing with kerosene, or liberally wetting all the perches with it. I have put it on chicks, a few days old only without damage, and with satisfaction. Soft food, too liberally fed, is dangerous, so far as my experience goes, especially in summer time, when green food is plenty; a fair proportion is beneficial either in summer or winter, but I am quite opposed to its reckless feeding, as some poultrymen recommend. It produces diarrhœa and debility if fed in excess.

Lameness in Horses.

The treatment of all injuries of the foot must be conducted on the same general principles. We must remember that the hoof, its horny covering, is of the nature of a closed box, which will not expand and accommodate itself correspondingly with the swollen and inflamed structures that it incloses and protects. Any person who may have suffered from a "whitlow" beneath the finger-nail can only form a slight idea of the agony experienced by the poor horses suffering from inflammation and suppuration within the hoof. The elasticity of the insensitive horn of the sole or frog usually closes the opening through which the injury has been inflicted, and there is no outlet for the pus or matter formed, the result of the inflammation, except at the coronet or above the horn at the heels. The original opening must, therefore, be searched for, the sole or frog well thinned around it, and a good and free orifice made, so that the matter can be freely discharged as it is formed, and the foot then placed in a warm bran poultice, till the inflammation has subsided and the discharge ceased.—*National Live-Stock Journal. Chicago*

Horses are subject to a disease of the eyes which comes and goes at short intervals until finally the sight is lost. This is called recurring or periodic opthalmia, or popularly "moon blindness," from its returning at monthly periods. The treatment should be thorough if the disease is to be stopped. Give a pound of epsom salts, and after this has operated one ounce of hyphosulphite of soda daily, for several weeks. Bathe the eyes with the following solution, viz., one dram of sulphate of zinc in a quart of water, and if the eye is scummed over and appears blue in the centre and inflamed around the lids inject a small quantity of it with a syringe. It will be well to repeat the purgative in a week if the inflammation is persistent. Feed no corn, but scalded oats and linseed, and keep the stable clean and clear from strong odors.

At the present time many farmers might usefully procure a few sheep for winter feeding and for early lambs in the spring. Any dry shed with a yard attached will serve to house them in. As manure makers, sheep are the most valuable of all farm animals. The shed should have the ground for a floor; a foot of straw—if cut all the better—is first laid down. In a short time this is trodden down and serves as a dry, absorbent bed for the sheep. More straw, leaves or other litter, the finer the better, is thrown on to keep the sheep clean. In this way a shed of 500 or 600 square feet of floor surface, containing 50 sheep, will become filled with manure two feet deep by the spring, giving 1,000 cubic feet of the best manure, or 25 two-horse loads, worth at least $1 a load; thus returning $1.50 per head for the manure alone.

FROZEN POTATOES.—A frost-bitten potato has no value except to cook immediately and feed to stock. After freezing, potatoes have a sweetish taste, indicating that some of the starch in the tuber has been changed to sugar, which, of course, is of the glucose variety, and not so sweet as that made from cane. A frost-bitten potato, however, decays so rapidly that great care should be taken to keep such from cellars or from pits of sound tubers.
