The expole of these pair nees should a six be performed from the beit engagement.

The preceding mannetons will be found tail, sufficient to expole the confer to man to the masquet with facinty in all directions, and give him confidence in using it with instantinge, whether engaged against one or those embolicitis.

# CONCLUDING REMARKS.

To become expert bayourt fencers, using the musquet as a two handed point swort, an exerboth later starg and effective, the loose practice of the fracing schools must be employed for this purpose.

A blant steel rod, the length of a bacone, and about the tuckness of a ling r, should be tixed in the harrel of an old masquet, in which a steel ware cork selew spring to in . sted, so as to admit of its springing in and out on ily when pressed.

Wire helmets, and masks for the face, with aves, grantlers and padard feature armor are to be used. Thus protected from acceptent, the blant sabre or practice sword can be substituted for the stick, and both parties carage, as if in sugle combat: bringing into play any combination of these instructions, as their own Judgment and dext rity may dictate,

Much depends upon the quickness of the eve, and the correct judgment of distance of the party using the musquet; keeping the Joint of the bayonet well in line of opponent's body, and taking care not to adon the saondeman to get wi his masur, shifting his own position to correspond with the movements of his apponent, enders on ig to hard and cutangle the sword with the shoulder of the bay net, what will be apto disarm him Should be change from one side to the other, and endeavor to ner are with feints, follow his sword with the bayoner, and bring at back to the same position, as in the cu-cle or counter parades in feature. Thus, if a hint is made at the left clock when

on the Right Engagem m, it should be answered as if intending to form "4th goard," and as ed as it intending to form "an guard," and as the swordsman changes to cat at the right sole of the body, follow the blade by dropping the point of the bay met under to the right, brings ing the sword back again to the left; in the same manner, if the feint should be made at the same manner, a the cent should be made at the right, and the cut at the upper left side of the bady, answer the first as if about to form the bady, answer the first as if about to form the "3.d guard;" follow the sword by propring the ipolet of the bayonet under to the left, and bringing it back to the sand place, instantly delivering a thrust.

Care must be taken to make the lunger short with the body well balanced and opeight, and musquet always held firmly with ooth Lands .-From the length of the musquet, the point of the bayonet will reach the opponent when i.e is out of distance, and by keeping a good opposi-tion defend him from a cut at the time of thrusting, by ruising or lowering the musquet to meet the blow. Should the swordsman succeed in the blow Should the sword-man succeed in advancing to close measure, the innequet mind be shortened by throwing it back telinid the shoulder to the full extent of the arm, (hoddink the small of the butt) sling up; the barrel resting upon the advanced arm, and hedy leading back, instantly striking out again with the small of the hyporate this may be my could be specied of the buyonet; this may be my could be point of the bayonet; this may be preceded by a short quick step back; or if the bayonet play cold sharp wind from the continue of points with a short Lunge, and swordsman soldiers are in this Irish Camp.

should defend with " 5th goard," of sword exererse, at the same time endeavoring to seize the havenet with his I.f. hand, the butunet player must disentangle his point, and spring back, ) out of reach of a soldier recent cat, out the same the form of position against the cut. This is done by bruging the advanced leg from Lungo position to the cut one, which is justantly torown back to engage position.

Changing arms advancing and retiring, whilst it rests the arms, will lend to derange the opponent's plac of attack, and a point can be readily given as the swordsman is advance ing or retreating. Should a sentry be sudden-ty araches in tear, it c Engaging guard can be readily changed by at once fitting about and coming to guard position. Thus, if in the position of Right Engage, turn on both beels, the left foot pointing to the left, and right foot and sent toot painting to the lett, and right foot and shoulder to the rear, changing held of the musquet with the Fight hand grasping stock and carrel, and the left on small of the butt. This position being the Left Engage "About," in same manners: suge to Right Engage." About."

No precise is or resons can be haid down, as desterny, and y acquired by practice, and the judgment of the party using the bay oner, who will adopt such movements in attacking or defending, or by counter attacks, as his knowledge and experience of the exercise may point out.

A GALE OF WIND ON THE CURROR.-Tuesday excange, Dec 9.—For the last twenty-four hours thus M many Camp, of about two years growth, which stands on the highest ridge of the Garagh proper, about a mile to the south of the Garad. Stand and the famous "run in," has been voited by a ver revere gate from the south, and, on the whole, the weeden canton-ment has, up to this time, most satisfactorily with-tood the shength of the enemy. A few leas have shown themselves in the roofs, some doors have been broken in, and windows smashed. The temporary wooden stabling, near the first Bagade Hos atal, on the extreme left of the Camp, has a flered, and the whole of the south brick wall to the new large racket court winch was in course of erection, has been torced in This latter building was to linve heen covered with a circular iron roof, with exhibit in centre, and the contractors had built the four walls up to within two feet of their proper height, allowing the interior to measure about niners feet long and thirty-eix feet broad. The damage already done to the court cannot be escanated at less than six to seven learnied townels, and great anxiety is extend as to the lature safety of the three other nales, which the contractors have been propplag up since this morning, when the crash took place. It was nearly about the same hour that the temporary stabling for the newly tormed Corps, "Military Train," had its roof, measuring about 120 feet by 45, broken in the back, and its norm side blown out—through there was no wonden side to the building on the south. Of course the wind som blew away the north side, which caused the roof to full in. In consequence of this accident, a detachment of the Buitary Tram horses, under a Captain, has been sent to Newbridge, two miles and a haif been sent to Newbridge, two miles and a non-eff, in which little town two Regiments of Cavalry—the Scots Greys, under Liemenant-Colonel Clarke, and ist III. Bragous with II troop of R. H. Arithers, Lient. Col. Turner, C. II., are mustered—the whole under the com-mand of Major-Ges. Parlby. 10th Hussars.— The buildings that here suffered most in the The buildings that have suffered most in the Campare the two large churches and several of the schools, particularly those in F and G quares, in fistening down the roots of which several Suppers, or Englicers as they are now called, were employed. Several sentry-boxes have been blown over, and others laki down for safety, but the most amusing seene is to see and hear the Indians of the 2nd Brigade and the Crimen s of the 1st, grumbling at a small leak over their bed, or seriously lomenting over a little water that comes in at hottom of the door, for want, perhaps, of a weatherhand. A con-sumptive patient at Brighton could not be more carefully attended to in this dreadful gale of a cold sharp wind from the could than our brane
