Taking all things at the lowest rate, our prices are a pretty fair approximation to the truth.
 To make per acre, we have added together all the grain harvested except the wheat, and taken the average per acre of all the land in
 bushels per acre.
 Consequently it is impossible to show how many head of horned-stock farmers keep per 100 acres, and how much pasture is necessary per
 order to arrive approximately at the number of acres and the yield per acre of the same grain because the census does not give it.
