

grouping of atoms as C.H.N.O. in created particles.

The atmosphere is composed of 5 constituents: Oxygen, nitrogen, carbonic-acid-gas, ammonia-gas, and watery vapour. It is described as viscid, and elastic, and it is the description of protoplasm as dilute, gaseous electricity.

As every particle of matter must contain the positive or the negative part of the H. atom, that part must be the magnet that holds together the whole construction of the universe. Is it not then the equilibrium of the "dilute gaseous electricity" in the construction of man that determines his length of life on the earth through the continual circulation of the H. atom?

We quote the following: "Wandering unconcernedly in the field of view of any high power microscope, there may be seen an animal which has probably been living continually, ever since life appeared on the earth, and which has certainly never had an ancestor by death. The creature is transparent and resembles a drop of slightly more viscid fluid in the thin film of water, in which it is confined. Amoeba is the name by which it is known to science.

Its form is continually changing until it resembles the fingers of an outstretched hand, of which the palm is rapidly shrinking. The whole creature is floating toward a small chain of bacteria, which presently it devours. There is no mouth through which they pass; they are simply engulfed, as small drops of water may be merged into larger. The Amoeba multiplies by splitting up into two new creatures. What has become of the original Amoeba? It must be said it is still living as the two new Amoeba. This splitting into two, being the only mode of reproduction of the race, it follows that all the previous parent Amoeba from which our present two are descended are still living.

Of course thousands of these animalculae are destroyed every day by natural foes, but it must be remembered that these unfortunates cannot by the nature of things leave any children, and so will never be ancestors, and that so long as any one Amoeba is living none of his direct ancestry is dead. The conclusion has forced itself upon biologists that death is no part of the life scheme of these creatures."

The principle of the everlasting circulation of the balanced cell as a living thing is proven in the construction of the Amoeba.

The attraction of the Amoeba by the bacteria was through the magnetic properties of the electrons, and we know that cells take their food through chemical attraction. The construction of the chemical in bacteria must have been determined before the construction of the Amoeba. Was it not the bacteria, as food, that caused the equal division of the Amoeba?

Bacteria divide and multiply in the same manner as does the Amoeba, so that the Bacteria Cell cannot know death.

All forms of matter have been found to be giving out radio active emanations, because the established equilibrium of the cell compels matter
