Electrical Transmission and Coal Supplies.

L. B. Stillwell, who for several years was an electrical director of the Niagara Falls Power Company, but who is now electrical director of the Rapid Transit Subway Company, of New York city, gives a good idea of the remarkable power plant that will supply electric energy to the Pan-American Exposition, when he says, in the Electrical Review, that "The plant of the Niagara Falls Power company best illustrates what electric transmission means as regards con-

servation of our coal supplies. The great plant is to-day putting out power which, if produced by a steam plant so economically designed and operated as to consume but three pounds of coal per kilowatt-hour at the switch-board, would require 800 tons each day of the year, or about 300,000 tons per annum. The average consumption of coal per electrical unit output in central station practice is at least twice three pounds, and the Niagara plant is therefore to-day doing work equivalent to that done by 600,000 tons of coal per annum, burned under conditions better than those prevailing in average central station practice in America, and this is accomplished without robbing the future since a water power is simply a solar engine and its energy may be utilized without subtracting a single horsepower from that which nature intended, not only for our age, but for future ages."

Under these conditions, with the great transmission cables leading from this power station to the terminal station that will supply the Exposition, it is any wonder that the Pan-American Exposition is destined to have electricity unlimited for light, heat and power purposes!
