

European and American cervix and perineum almost endless medication. The convulsions concealed a loaded colon, organs, and renal in the convulsions arose of her pelvis, which, produce convulsions, as a congested condition. This was shown by preceded by an intense left lower extremity, uncontrollable until the left leg, and could be left side of the pelvis. With ether and ice was not. Pain through the too much standing, must the same as would here never was a continuous disturbance of the of the pelvis for treatment. It was considered to be relieved by any as would be arrested; colon and a diuretic also daily used. The For weeks the daily away looking like surplus of bile, which of stomach indigestion which she had had for

improved the patient during of the flushings, period of nineteen

months. During that time she again visited Europe, relaxed her vigilance as to the care of her health, returning to America in January of the present year. Her face showed that she was absorbing feces again, and in various ways she indicated that her trouble was returning. Before she left for Europe the pelvic organs were in a condition demanding no further treatment. She was urged to return to her flushings, which she omitted to do, and went straight on her iniquitous course of neglecting herself, and in February, about a month later, she had one of the most terrific convulsions she had ever experienced.

I believe that the flushings did for this patient what medicine could not do. They thoroughly evacuated her bowel and gave her alimentary canal a chance to absorb food instead of feces. I furthermore consider that the successful treatment of this patient with medicine, without flushings of the colon, will be entirely unsuccessful.

Case VI.—Miss O. has been having chills daily, has a constant bad taste in the mouth, has vertigo, scalding urine, has eczema extensively in the right hand and fingers. Examination reveals a loaded colon, although her bowels may move nearly every day. Ordered daily flushings of the colon, a daily laxative, and the potash citrate. In a week the chills ceased entirely, the vertigo had disappeared, the urine was improving. Medicines stopped, and the flushings continued for a period of six weeks daily. The surprising thing is that at the end of six weeks the hand was entirely well.

The question comes up, was not the eczematous condition of the hand a thing permitted to supervene from fecal absorption?

Case VII.—Mrs. D., aged 29, has psoriasis covering a large portion of her body. She had as much unsound as sound skin, has had it more or less since the 8th year of her age. She is gouty, has gastric indigestion, headaches every two or three weeks, which always wind up with vomiting. After giving her medicines for a period
