

pavilion. A room is set apart for this plant in the attic space, and the water for drinking purposes is cooled and circulated throughout the building.

The heating is by hot water, forced by pumps from the hospital boiler plant through a special tunnel. The radiators are set away from the wall and floor, and are supported on brackets.

The nurses' call system consists of a locking push button on each bedside, recording the number of the room at the various nurses' stations on each floor by a silent electric light annunciator, and by a signal light over the door of the patient. In addition to this, an elapsed-time recorder, making a record of the exact time and the duration of every call, is provided in the main office of the building.

Exhaust ventilation is provided by means of fans direct connected to electric motors. The air is drawn from the rooms through tile ducts.
