

start a propaganda among the children. It would be easy for any child to save enough to buy a peach or apple-tree cutting, to purchase a vine or even a young maple. Northern France is about as bare as the sands of the seashore, and here is an excellent chance to do some constructive work which will cost individuals little but will amount to much in the aggregate.

FRANCE'S FOREST INCOME

The gross annual income of the state owned forests of France prior to the war is said to have been \$6,000,000, or \$2.72 per acre of producing forest. The total expenditure amounted to \$2,725,000, or 70 cents per acre. Therefore prior to the great war the annual net forest income amounted to \$2.02 per acre.

Raphael Zon, chief of sylvics, U. S. Forest Service, tells us that the forest area of France contains 20 per cent. conifers and 80 per cent. hardwoods (35 per cent. of this being ordinary oak and 4 per cent. stone oak).
