24 Victoria Square, MONTREAL.

The corn crop of 1895 will probably be at least 250,000,000 bushels greater than the largest crop ever before harvested in the United States. Transportation companies estimate the yield the year at 2,400,000,000 bushels, while statisticians who take government reports as their basis figure it at 2,275,000,000 bushels. The difference of 25,000,000 bushels is of small significance in so immense an aggregate. Of course corn is not harvested yet, but there are no visible probabilities of damage to the growing crop that will change the figures to any great extent. The Chicago Chronicle has been looking into the subject of prices, and finds the average values of the 1890 crop to have been 28.3 cents per bushel; of the 1892 crop, 40.6 cents; of the 1889 crop, 34.1 cents; of the 1888 crop, 41.4 cents; of the 1891 crop, 50.6 cents.

The Chronicle says:—"This goes to show that the larger the crop the lower the price as a general thing, though the average price for the great crop of 1892 was nearly as high as the minimum crop of 1888. It is true that the total value of the maximum crop of 1890 was nearly \$160,000,000 less than for the far smaller crop of 1891, but on the other hand, the total value of the great crop of 1892 was \$82,000,000 greater than that of any other year. Experience therefore, does not necessarily discourage the expectation that the growing crop will bring more than any former crop brought, while the fact that last year's yield was the smallest since 1874 goes directly to encourage such an expectation. It is not impossible that the value will average 35 cents even if the crop reaches the 2,400,000,000 bushels estimated by railroad men, and in that case the total value will be no less than \$840,000,000."—Ex.
