

## REPTILIA

INDIAN COMY. *Naja tripudians*. Plate LXI.

The general coloration of the fundus oculi in this Snake is light gray-blue, sparsely dotted with pigment of a similar but deeper color. The whole background is regularly covered with opaque nerve fibres. From the button-like optic disc arise three vessels, apparently two arteries of small size and one larger vessel—probably a vein. The centre of the papilla shows the remains of the undeveloped tissues of a pecten.
