

*Farm Poultry*

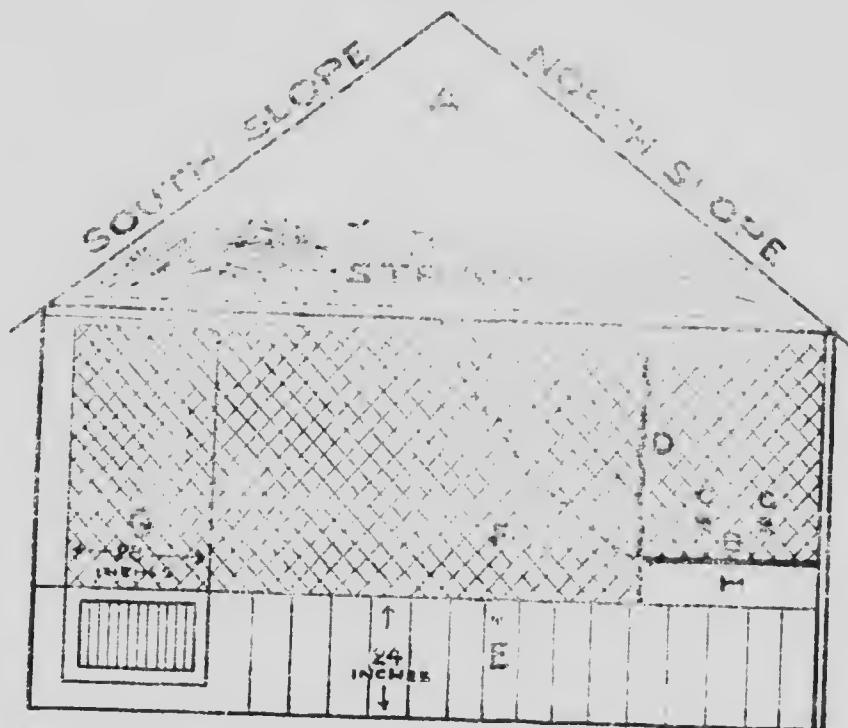

Fig. 1.—Cross section of a curtain-front, straw-loft Poultry House suitable for the farm. Can be built any length desired.

three feet from the floor. Eight inches above this platform are two roosts or perches. These are made of three by three scantlings. There are drop curtains in front of the roosts. They are hinged to the ceiling and dropped down at night when the temperature goes low—that is, below zero. All the curtains are of the best grade of mohair cloth—thick, coarse, and made of inch slats. Two sets of straw is placed on the starting roost. With the curtain front as is used in this house in combination with the straw loft, an excellent circulation of fresh air is obtained. The house is well ventilated and quite dry. Straw is a good insulator and it also absorbs the moisture. On account of the large volume of air above the floor in the peak of the house there is a steady interchange of warm air and cold air going on continuously. The runways for the hens are located on the south side of the house.

An equal slope of roof on both sides of the house is always better than only one slope or a short and a long one. If the long slope is on the south side, the house will always be inclined to be damp. Then too, having an unequal slope will not permit of having sufficient space in the loft to get a good circulation of air. In some houses where the straw
