NOW COMPLETE.

A SERIES OF TEXT-BOOKS ON PHYSICAL SCIENCE. HANDBOOKS OF NATURAL PHILOSOPHY AND ASTRONOMY.

BY DIONYSIUS LARDNER, D. C. L.,

Formerly Professor of Natural Philosophy and Astronomy in University College, London.

This valuable series is now complete, consisting of three Courses, as follows :---

FIRST COURSE.

MECHANICS, HYDROSTATICS, HYDRAULICS, PNEUMATICS, SOUND, AND OPTICS. In one large royal 12mo. volume, of 750 pages, with 424 illustrations. \$1 75.

SECOND COURSE,

HEAT, MAGNETISM, COMMON BLECTBICITY, AND VOLTAIC ELECTRICITY.

In one royal 12mo. volume, of 450 pages, with 244 illustrations. \$1 25.

THIRD COURSE.

ASTRONOMY AND METEOROLOGY.

In one very large royal 12mo, volume, of nearly 800 pages, with 37 plates and over 200 illustrations. \$2 00.

These volumes can be had either separately or in uniform sets, containing

About two thousand pages, and nearly one thousand Illustrations on Steel and Wood.

To accommodate those who desire separate treatises on the leading departments of Natura Philosophy, the First Course may also be had, divided in three portions, viz t-

Part I. MECHANICS.

Part H. Hypnostatics, Hypnaulics, PNEUMAtics, and Sound.

It will thus he seen that this work furnishes either a complete course of instruction on these

abject or reparate treaties or all the different branches of Physical Science. The object of the author has been to propare a vork suited equally for the collegiate, acade-mical, and private student, who may desire to acquain thimself with the present state of science, in its most advanced condition, without pursuing it through its mathematical consequences and details. Great industry has been manifested throughout the work to elucidate the principles ad-vanced by their practical applications to the wants and purposes of civilized life, a task to which Vanced by their practical applications to the wants and purposes of contributed life, a task to which Dr. Lardner's immense and waried knowledge, and his singular felicity and clearness of illustra-tion render him admirably fitted. This peculiarity of the work recommends it especially as the text-book for a practical age and country such as ours, as it interests the student's mind by show-ing him the utility of his studies, while it directs his stiention to the further estension of that utility by the fulness of its examples. Its extensive adoption in many of our meet distinguished of the distinguished period. colleges and seminaries is sufficient proof of the skill with which the anthor's intentions have been carried out.

From Prof. Kirkwood, Delawure College.

After a careful examination, I am prepared to sty that it is the most complete "Handbook of Astrono-my" with which I am acquainted. I trust the demar d for the work will be commensurate with its merits.

From Prof. A. Coswell, Brown University.

I regard it as a very useful and very convenient popular compend of the sciences of which it resus. It is full of information and well illustrated. It de-serves a place armong the best educational treaties on Astronomy and Physics.

From Prof. W. L. Brown, Oakland College, Miss.

I consider them most admirably suited for the purposes designed by the author-indeed, as the very best popular works on physical science with which I am acquainted. The "Third Course" on Astronomy, is sepecially valuable; its magnificent engrav-ings and lucid explanations make it a most desirable text-book.

From Prof. R. Z. Mason, McKendree College, Ill.

In my judgment it contains the best selection of compact demonstrations and popular illustrations that we have a yet received on the subject. Dr. Lardner has relieved it somewhat from the dry details of Mathematics, and yet there is such a close addrenete to severe methods of thought as to satisfy the most work and careful august

de: fully minute, and yet not proliz. The principles of Astronomy are probably as clearly defined and judiciously arranged in this book as they can be. 1 expect to introduce it in my school.

Part III. OPTICS.

rom S. Schooler, Esq., Hanaver Academy, Va.

The three volumes constitute a body of information The three volumes constitute a body of information and detail on nearly the whole range of physical science which is not to be found together in any other publication with which I am acquainted. I hope that these works may be the means of inducing many of our youth to devote themselves to the de-velopment of the Lawsof Nature, and the application of them to industry, and that they may be the vehicle for conveying sound information and iood for thought to every man who aspires to be well clucated.

From M. Conant, State Normal School, Mass.

This is a treatise admirably adapted to its purpose. For the securate knowledge it unfolds, and the very popular dress it appears in, i think I have met with nothing like it. I shall advise the sudents of the Normal School to add this to your edition of Lardner's Mechanics, &c.

From Prof. E. Everett, New Orleans.

nes recueven it somewhat from the dry actuits of Nathematics, and yet hore is such a close addrerence to severe methods of thought as to satisfy the most rgid and careful suelyst. From Rev. J. G. Rakton, Norristonen, Pa. Lardner's Meteorology and Astronomy is a fictom-panion for his First and Second Course. It is won-
