sentation in Parliament, is found beset with practical difficulties, some of which the Sciool Guardian forcibly points out. In the first piace there is the difficuity of getting constituencies to return their candidates. Theat their representatives, once elected, would be no longer teachers but only ex-teachers. Again as no man can serve two maters, the representative elected rould be in a very avkward position. Will he be the servant of the constituency which rearns him or of the Union which supportshim? Worst difficuity of all, as the mernbershu of the Uniors is made up of Liberals and Conservatives, shall the candidates be Liberal or Conservative? Upor this rock the novement will probably split. To at, unlooker it would cortainly seem as if the Union might influence legisla. tinn, much more hopefully from without Parliament, than from within. Its power which is happily becomarg considerable, may effiect more by being brought to bear through a number of representatives, than if the duty of representing advanced views were left to rest upon the shoulders $o$. one or two specially chosen members.

There is no accounting for taste in logic any more than in Aress or decoration. Mest educationists will join with the London [Eng.] Schoot,naster in deprecating the cruelty and cowardice of such "bullying" in the Public Schoois as led to the death of the poor lad at King's College, but feiv will be able to see the iorce of the argument whick that Journal quotes with approval from The Qusen, and which regards "this lamentaile occurrence as in great part fue to the maudlin and mawkish sentimentality of the age," the sentimentality, viz: which " is opposed to the infliction of corporal punishment." "At a good Public School," argues the Quec", "where the master has the authurity of a parent delegated to him, and can inflict corporal punishment if he sees fit to do so, such an act of syranny as the killing of a boy by the elder scholars would not occur, as the bullies would dread the sound flogging they would receive for every act of tyranny practised by them. "This is surely applying the principle of similia similibus in logic with a vengeance. It reminds us of the anecdote we have somewhere ruadin which a father is represented as reproving his son in terms of awful profanity for swearing. The argument is surely on the lucus a non lucendo principle.

## PROFESSIONAL READING.

We-notice that at one or two of the Teacher's Associations resolutions have been passed favouring the proposalito have a course of professional reading prescribed by the Minister of Education, as a kind of post-graduate course for members of the profession. This desire for further improvement is laudableNo one, with a spark of the true teacher's spirit in him, will wish to "rest and be thanktul," when once he has secured his certificate and a tolerable situation. But is there not a more excellent way of progress? Cannot a large body of intelligent, educated men and women do better than follow a uniform, monotonous, cui-and-dried course, madeready for them by the Education Department? W not take the matter into their
own hands, emanicipats these readings from the fetters of departmental routine, and, reiying upon the ample resources of their own complex individuality, form their own reading circles and mark out their own courses? Those courses will be all the better for not being too strictly protessional. A generous admixture of general literature of a high class will make it more stimulating and more broadening. Nor 's it at all desirable that all ceachers throughout the province oi Ontario even should read the same course? On the contrary, both the profession and the country will be the better for a variety. If any number of teachers from half a dozen, or less, to half a hundred, can consult together, agree upon three months' reading, and make arrangement fur regular interchange of thought and work either at stated meetings or by systematized correspondence, we verture to say better results will be gained than are possible from any authorized routine? The benefit to be gained will be proportioned not to the amount or quality of the matter sead, nor even to the thoroughness with which the ideas of celebrated educators are learned, but rather to the amount of individual thought and application secured. For this there is nothing like the friction of mind with mind, the free interchange of opinion and criticism.

## METHODS OF TEACHING.

A writer in the New England Journal of Education asks his readers whether it has ever occurred to them in looking through some of the new primary and oral arthmetics that the author was afraid the children might have something to do. The question suggests a fault which, it seems to us, besets many of the socalled new methods as well as new books. It is the danger which threatens the kindergarten. In reading the "Quincy Methods," excellent as its lessons are in many respects, and full ci helpful hints as to the best meians of getting at the child mind, the query perpetually recurs, can there really be living children of four or five years of age and upwards, who require to have every obstacle in their pathway so finely pulverized, and all their mental pabulum so wonderfully diluted? No doubt there are such children and as long as the methods in question are strictly adapted to the mental state and needs of the little ones, ihey are truly admirable. The great danger is that many teachers may, through error in judgment, go on pulverizing and diluting to the injury of the child whose brain craves heartier food and the more vigorous exercise necessary for healthful growth.
It must never be forgotten that the intellect of the child, no less than its limbs, must be strengthened by exertion, and that the healthy child delights just as much in the vigorous use of the one as of the other. We all know how the average child enjoys the most vigorous gymnastic feats of which it is capable, at the various stages of growth. Nothing is more contrary to its nature, or mure repugnant to its impulses, than to be helped to do that which it can do for itself, or to be restrained by leading strings when it would gambol and tumble at its own sweet will. It is the gambolling and tumbling, not the helping hiand or the leading string which strengthens bone and muscle. And the healthful child is formed to take just as much pleasure
