And Coal Economy

OMBUSTION taking place in the dome or

fumes. This combustion produces heat-energy,

which the radiating surfaces above and around

fire-pot absorb or draw in and then deflect or

throw off. Incoming cold air receives this heat-

energy, the result being heated air. Now, if the

combustion takes place at a faster rate than the

radiating surfaces can absorb and deflect, the

surplus heat-power will pass up the chimney or

There is no waste of coal in "Sunshine" Furnace.

Circuit of radiator is so complete, and air-

circulating space so large, that every bit of

heat-energy is quickly absorbed and quickly

deflected on the circulating cold air, which

is thus quickly heated and ascends through

The check-draft of a furnace is situated on

the smoke-pipe. When this draft is closed-

especially on an "ordinary" furnace-heat

particles can escape up chimney. When check-

draft is opened the incoming cold air from the

cellar drives all heat particles back into furnace

proper. If the grates and fire-pot of furnace are

not constructed properly, there's a clogging and

gathering of ashes, and fire does not burn up

readily. If no provision is made for gas escape,

the check-draft must be left closed indefinitely-

There is no waste of coal in "Sunshine" Furnace.

No clogging can take place in the 4-piece

grate, no ashes can gather on the straight

fire-pot walls, and the Automatic Gas

Damper makes every provision for the

escape of gas; consequently, check-draft

can be opened shortly after coaling and all

heat-energy saved for radiation.
