preventable diseases formed by, 8: germs the only cause of, 11: chief points in recognition of. 12 ff.; diagram of course of, 14; incubation period. 16: determining date of infection, 16-17; date of earliest symptoms, 18-19; period of prodromal symptoms, 19-20; date of appearance of typical symptoms, 20; third period, or fastigium, 20-21; convalescent period, 21-22; decubation period, 22-23; prolonged decubates less dangerous than prolonged incubates, 24-25: typhoid fever as a type of, 27-38; paratyphoid A and B, 38; typhus fever, 38-39; scarlet fever. Duke's disease, and measles, 40; epidemiology the science and the art of dealing with, 108; practice of epidemiology as affecting, 109-123.

- Inoculation against typhoid fever, 34.
- Insects harmful to man, 169–174.
- Intestinal diseases, carried by water supplies, 159; caused by flies and other insects, 169, 173.
- Isolation, of infectious diseases, 50; of whooping cough cases, 68; of venercal cases, 81–82; of leprosy cases, 92; a part of the practice of epidemiology, 115– 116.
- Itch-mite, responsible for scabies, 174.

Leprosy, a germ disease, 91–92. Lice, typhus germ conveyed by, 39, 173; three forms of, 173; treatment for, 173.

Measles, potential patients not

infectious during incubation period, 17; an eruptive infectious disease, 40; produced by a germ, 41; history of disease compared with that of scarlet fever, 43-49.

Medicinal waters, 158.

- Milk, germ of bovine tuberculosis in, 84, 162, 168: consideration of characteristics of, as a human food, 161: dirtiness of, as a food, 161-162; representatives of all the chief forms of food found in, 162; percentage of different constituents in. 162-163; points to consider in securing at its best, 163-164; how tuberculosis germs may enter, 164: percentage composition of, controlled by breed of cow, 164; bacterial growth in, 164-165; methods of preserving, 166: modifying, for babies, 167; cow's, at best only a fair substitute for human milk for babies, 167; substitutes for wet nursing, 167-168; diseases caused by, 168.
- Mosquitoes, as disease carriers, 171–172; preventive measures against, 172–173.

Mumps, characteristics of, 68–70.

- Nitrogen, contained in protein foods, 139–140.
- Observation of contacts, 117, 119-120.

Onset of disease, date of, 19.

Oxygen, the part of the air needed by human body, 127; supplying of, to the body not the prime object of ventilation, 130, 133; effect of, on disease germs, 181–182.
