of the country to fight the city in main-taining the principle that he says has for the sum of Two Hundred Thousand Dollars (\$200,000), the vendors accepting 800,000 fully-paid been fought out in nearly every city in shares of the company's stock or cash in payment. WORKING CAPITAL.

The remaining 200,000 shares are to be set aside as working capital for development purposes.

The Poorman mineral claim was crown granted February 7, 1891. Preliminary steps have been taken for obtaining a crown grant for the Hardscrabble. Crown grants for the remaining claims will be obtained as quickly as possible. EXPENSES AND COMMISSIONS.

way by August 1. The change will be made without interfering with the narrow guage train service, and the road

The estimated amount required as preliminary expenses is placed at \$5,000, and a commission of 25 per cent is allowed to the promoters out of which the prelimsnary expenses and all other expenses in floating the company will be paid.

Revolver While in Jail.

Subscriptions are invited for an issue of one million shares of the company's stock of the par value of Twenty-five cents each. Applications are to be made to the company's secretary and no application for less than 500 shares will be received. Shares are to be fully paid on allotment application for less than 500 shares will be received. Shares are to be fully paid on allotment to applicants. The provisional directors have each subscribed for 500 shares, excepting J. Fred Hume, who has subscribed for 1,000. REPORT ON THE POORMAN.

The following are extracts from the very full report of Messrs. Bewick, Moreing & Co., mining engineers, of London, Eng.:

engineers, of London, Eng.:

The property is situated on the northern flanks of Toad Mountain about two miles west of Nelson, and with an altitude of 1,500 to 2,500 feet above sea level. It consists of five claims with an area of about 130 acres.

GEOLOGICAL FEATURES AND VEINS. The rock occuring throughout the property is a hard mica-syenite, traversed in several directions by eruptive dykes. The rocks are mostly concealed by heavy accumulations of detrital matter so that the outcrop of veins make very little display on the surface.

There are three known quartz veins intersecting the property, but only two of them have been operated on to any extent. One of these occurs on the Poorman, and has been proved, partly by mining and partly by trenching for a length of about 1,000 feet; but the property on the line of the vein has a length of 4,500 feet. Where proved, the thickness of quartz varies from three inches to five and a half feet, and averages about two feet three inches.

The other vein alluded to is in the White. Where worked it has a thickness of about seven feet, including country rock. Along the hanging wall there is a rib of quartz varying from six

The other vein alluded to is in the white. Where worked it has a thickness of about seven feet, including country rock. Along the hanging wall there is a rib of quartz varying from six inches to eighteen inches in thickness, and on the foot wall is a similar rib ranging from six to twenty-four inches. The intervening area is composed mainly of country rock traversed by stringers of quartz, which are some times so numerous and valuable that the vein is worked from wall to wall CHARACTER OF ORE.

The ore in all the veins has the same general character, and consists of milky quartz, mostly traversed by threads, stringers and bunches of auriferous pyrite with a little galena and chalcotraversed by threads, stringers and bunches of auriferous pyrite with a little galena and chalcotraversed by threads, stringers and bunches of auriferous pyrite with a little galena and chalcotraverse but in some places the quartz is perfectly white and free from pyrite. Occasionally, when jointy, this white quartz carries a considerable amount of visible gold. The more important source of this metal, however, is the pyrite and other sulphides existing in the ore, which, when source of this metal, however, is the pyrite and other sulphides existing in the ore, which, when taken alone, run very high in gold. The gold is mostly "free." Only about 1½ per cent of concentrates are produced in milling. These have an average value of about \$24.00 per ton, or 36 centrates are produced in milling. These have an average value of about \$24.00 per ton, or 36 centrates are produced in milling. These have an average value of about \$24.00 per ton, or 36 centrates are produced in milling. These have an average value of about \$24.00 per ton in the tailings. Much of this doubtless could be saved economically with additional plant.

Assays of average samples taken by us give the value of the ore in the Poorman mine at .84 ozs. per ton of gold and .65 ozs. per ton of silver. In the White, .93 ozs. of gold and .5 ozs. of silver. WORK DONE ON THE VEINS.

Most of the ground in the Poorman above the top level, affording about fifty feet of "backs," has been stoped away, but below that level very little stoping has been done, the late owners,

being men of little capital, having been unable to set aside a sufficient amount from the profits of stoping to enable them to keep their development work sufficiently advanced, so that they ultimately arrived at a stage in which the available stopes were nearly exhaused and nothing but development work could be done for some time. That appears to be the reason for parting with their property. At any rate it is a perfectly good reason for men in their position.

Before an adequate output of ore can be obtained, it is necessary to continue a tunnel which has been commenced about 160 feet vertically below the upper tunnel. To the date of our inspection it has been driven about twenty fathoms, but it needs to go fifty fathoms further, and this will cost about \$2,700. It will then be necessary to drive right and left along the vein to open up will cost about \$2,700. It will then be necessary to drive right and left along the vein to open up stoping ground, so that on the Poorman an expenditure, underground, of about \$4,000 is required before a profitable output can be obtained. To work the vein by means of the shaft commenced in the mine is quite out of the question in view of the possibility of reaching a lower level by means of the tunnel alluded to; ist, because the cost of opening up ground by sinking would be much greater, and secondly, the working costs would be increased by hoisting and pumping.

At the White the only work done is a short drift put into the hillside at an altitude of about 460 feet above the lower Poorman tunnel, and 270 tons of ore have been extracted. Of this quantity 50 tons were put through the mill, the remainder was on the ground at the mouth of the drift

Here a deeper tunnel should be driven, the cost of which would be about \$3,000.

There is a 10-stamp mill in good order, but poorly housed. It stands about 240 feet vertically below the Poorman lower level. It contains: One Blake crusher, 11x9 inches; ten 850 pound stamps; two "Challenge" feeders; three vanners. This machinery is actuated by a four-foot Pelton wheel driven by water, having about 230 feet head. The capacity of this mill should be doubled. To do this it will be necessary to make some addition to the water supply. This can be done quite easily. It will be necessary to introduce an improved tailings plant, so as to save some of the gold that now goes down the stream.

OTHER MACHINERY AND PLANT.

In addition to the mill there is on the ground: One air compressor and receiver for driving three drills, and about 2,500 feet of two-inch pipe leading up to the mine. This machinery is driven by the Pelton wheel. One rock drill; one hoist, 4x6 inches, with 6-inch drum geared 5 to 1; one vertical boiler, 8x3 feet diameter; one Knowles sinking pump, 10x14 inch steam and 6-inch ram, with 4-inch suction and 3-inch delivery. Both hoist and pump are arranged to work either by steam or compressed air.

Also a considerable length of rails and pipes of various sizes, from one-half to one and a half inches, and all necessary cars and tools to work the mine on the small scale it has hitherto been

worked. The mine is equipped with a sufficiency of wooden buildings. FUTURE WORKING.

Besides completing the lower tunnel at Poorman, a deeper tunnel should be made at White. These works, with the necessary drifting along the lodes, which will take about six months, will render it possible to obtain an output of fifty tons per day or 15,000 tons per year.

The development work suggested would (provided no unforseen occurrence interferes with the yield of the vein), with this rate of extraction, serve for between three and four years' output at least. The lower tunnel at Poorman is about 260 feet vertically above the mill, and the White tunnel about 710 feet above it, so that there are abundant "backs" for years to come that can be reached in the most advantageous manner.

ESTIMATED COST-OF WORKING.

When the suggested new works are completed, we estimate that the cost of working will not exceed the following, and probably will be less: Mining, \$4.00; Milling, \$1.00; Superintendence \$.65; Sundries, \$.35; Total \$6.00 per ton. Taking the net value of the ore at only \$14.00 per ton to allow for deterioration, there will be a profit of \$8.00 per ton, or \$120,000 a year on an output of 15,000 tons.

COST OF NEW WORKS, ETC.

The cost of the extensions to the mill, and other works needed to enable the before mentioned output to be obtained, is estimated at \$22,000, as detailed as follows: Mine development, \$7,000; output to be obtained, is estimated at \$22,000, as detailed as follows: Mine development, \$7,000; Ten stamps and accessories, with new building, \$10,000; Flume from Sandy creek, \$3,500; Sundry works and payments, \$1,500; Total, \$22,000.

VALUE OF MINE.

From a consideration of the foregoing figures and of the circumstances surrounding the mine, we are led to the conclusion that the value of the property may be sately taken at \$240,000. In fixing upon this value we make ample allowance for all the risks attendant upon this class of fixing upon this value we make ample allowance for all the risks attendant upon this class of (Signed) BEWICK, MOREING & CO.
