(Revised April 1977)

Canada's vast territory is divided into three major geographical regions: the Atlantic, the St. Lawrence and Great Lakes basins, and the western and northern regions. The Atlantic region, including the Maritime Provinces and the Gulf of St. Lawrence, is characterized by rugged, rocky terrain. The St. Lawrence and Great Lakes basins, which include the provinces of Ontario and Quebec, are dominated by the Great Lakes and the St. Lawrence River. The western and northern regions, including the Prairie Provinces, the Yukon, Northwest Territories, and Nunavut, are characterized by vast, open spaces and rugged, mountainous terrain. The Rocky Mountains, the Canadian Rockies, and the Yukon and Cordillera ranges are prominent features of these regions. The terrain is generally rugged and mountainous, with high peaks and deep valleys. The climate is generally cold and dry, with long winters and short summers. The population is sparse, with most people living in a few major cities and towns. The transportation infrastructure is limited, with few roads and no railroads. The only mode of transportation is air travel, which is provided by a few airlines. The terrain is generally rugged and mountainous, with high peaks and deep valleys. Canada's ability to do so is vital to the nation's very existence. All forms of transportation are vital to the well-being of Canadians from coast to coast.

Marine transport

Canada's marine transport system is one of the most advanced in the world. It is a vital link between the east and west coasts of the country. The system is based on a network of ports and shipping lines. The ports are located along the Atlantic, Pacific, and Great Lakes coasts. The shipping lines provide regular service between these ports. The system is highly efficient and reliable. It is a vital link between the east and west coasts of the country.
