## UNABLE TO WALK FOR A YEAR

#### Paralysis Entirely Relieved by "Fruit-a-tives"

The Wonderful Fruit Medicine

Paralysis is a break-down of the Nervous System and affects the victim in various ways. Sometimes, ria, insomnia, constant headaches, or it may be so bad that one is partially or completely helpless in some part of the body, just as Mrs. Heacock

"When I was twenty-eight years of age, my doctor advised me to have an operation, which I did and it and unable to walk for a year. Seeing your "Fruit-a-tives" advertised in the papers, I decided to try them. ed to use them regularly and today I am able to go about my home duties and care for my family".

MRS. J. W. HEACOCK.

Any form of Nervousness is often caused by, and is always aggravated by, Constipation, which poisons the blood, irritates the kidneys and inflames the nerves. "Fruit-a-tives" stimu lates the action of liver and bowels, k. Jueys and skin-tones and sweetens the sto-mach-keeps the blood pure, and builds

up the entire nervous system.

In a word, "Fruit-a-tives" has proved that it is the most scientific and effective remedy in the world for Nervousness or a disordered

## **ABOUT THE SILO FILLING**

Both Cutting Outfit and Moisture Content Important.

Have Sufficient Horse-power for Cut-ting—How to Control the Moisture Content-Mustard-Advantages of Daigying.

(Contributed by Ontario Department of Agriculture, Toronto.)

When silo filling is to be done quickly, that is, one hundred or more tons of fodder cut per day, the cutter and the power must be in keeping with the work at hand. An eighteen horse-power engine or motor and a fourteen-inch blower cutter will handle one hundred tons per day. Where smaller silos are used and the farmer desires to, or has to, do the work largely with the farm help, small cutters can be used. Eight-inch cutters will handle three tons per hour if driven by an engine of not less than eight horse-power.

Have Sufficient Horse-power Cutting.

Claims are often made that two or three horse-power outfits can do effective work, but this is a mistake. If the work is to be done quickly and effectively with the best use of labor the power should be ample. If it is desired to cut forty tons per day the power should be not less than eight horse. Sixty tons per day the power should be twelve horse. One hundred tons per day will require an hundred tons per day will require an eighteen horse-power engine. The cutter should be of the proper size for the power used. Carrier cutters do not require as much power as do the blower cutters, but the advantage of easier erection, simplicity and ease of wetting the fodder through the use of the blower offsets the ingressed power requirement. Cylinder the use of the blower offsets the increased power requirement. Cylinder and knife on fly-wheel types of machines are equally satisfactory providing of course that they are equally well built. Low priced, poorly constructed fodder cutters are dangerous. Select a cutter with a good reputation, and one that is as well built as a good steam engine is built. Moisture Content Important. Moisture Content Important.

It is essential that there should be sufficient moisture present in the fodder at the time it is being put into the silo to provide the water requirement for the ensiling process and leave the surplus necessary to have amply moist well made silage, after the fermentative and cooling with sufprocesses have taken place. With sufficient moisture present in the ensiled mass there is little danger of the fermentation temperatures running too high, the greater the amount of water present the firmer the cut fodder will pack and the smaller the spaces for air. Corn in the early glazed or denting stage, oats, peas or vitch green enough for high grade hay making carry sufficient water in the natural juices to meet the requirement for ensilage. Frequently ocesses have taken place. With sufthe natural juices to meet quirement for ensilage. Fr it is necessary to use corn, oats, peas or sunflowers that have suffered from drouth, or have dried through de-lays or have been permitted to remain unharvested until long past the best unharvested until long past the best condition for silage making. If so, the shortage of plant juices can be made up by the application of water in quantity sufficient to thoroughly wet the fodder.

How to Apply the Extra Moisture. Water is best applied by running a stream directly into the fodder cut-ter while the fodder is being passed through and blown up into the silo. garden hose the process of wetting the cut fodder is easily accomplished. Corn fodder that has remained in the field until Deember and become quite dry can be successfully ensiled if sufficient attention is paid to wetting and packing thoroughly in the silo. The wetting must be complete and all the air possible pressed out by tramping the evenly spread cut fodder as it goes into the silo. With red clover, alfalfa, peas, oats, vetch, rye, aweet clover, mustard, grasses, sunflower, corn or artichoke stalks, there is little likelihood of overdoing the wetting if a stave silo is used, since such a structure permits any surplus moisture to drain away. With water tight cement concrete or tile silos a Corn fodder that has remained in the INSURANCE

Mustard.

Fields that are heavily infested with mustard can frequently be turned to good account by using such areas for the production of silage fodders. The sowing of peas and oats in the proportion of one bushel of oats to one bushel of peas per acre (the mustard will come volunteer), will make a very acceptable silage. Mustard has a high feeding value, and the seed in the soil can be exhausted in time by following the practice of using mustard infested lands for silage crops, cutting the entire mass, cereal, legume and weeds and putting all in the silo in a finely cut and packed condition.
