

	PAGE
Plate XXI—Gasolene locomotive drawing peat cars	172
" XXII—Peat storage bin, capacity 2000 metric tons; workmen's dwellings in background	174
" XXIII—Peat burning furnace, with movable bars, as applied to Babcock & Wilcox boilers	178
" XXIV—Completed portion of canal in front of power house ..	184
" XXV—Plough in operation	188
" XXVI—Anchor wagon	188
" XXVII—Harrow employed on the Wiesmoor	188
" XXVIII—Roller used on the Wiesmoor after the operation of harrowing has been completed	188
" XXIX—Appearance of bog when completely cultivated and settled by homesteaders	190

Drawings.

Fig. 1—Anrep pulping mill	13
" 2—Rotating and fixed knives of the Anrep pulping mill	14
" 3—Layout of track system and drying field, and arrangement for operating field press—Anrep system	16
" 4—Detail of arrangement for taking up strain on cable—Moore's system for transporting pulped peat to drying field	18
" 5—Arrangement of tracks, and general layout of drying field—Dolberg's system	22
" 6—Details of Dolberg's peat plant showing peat machine, elevator, and motor	23
" 7—Details of Strenge's peat machine	24
" 8—Curves illustrating the relation between the pressure employed and quantity of water expelled	33
" 9—Ideal diagrammatic section of apparatus employed for carrying out the Ekenberg wet carbonizing process	34
" 10—Curves showing when the process of drying with heat produced by the combustion of peat containing varying percentages of moisture becomes impossible	40
" 11—Curves showing the pounds of moisture present per pound of air for varying degrees of saturation and temperature	45
" 12—Curves showing the number of heat units in the peat which would be required to drive the air over the moist substance	46
" 13—Curves showing the higher and lower calorific power per pound of peat containing different percentages of moisture, and the quantity of heat required to evaporate and superheat the moisture removed	55
