

4. Are the disorders of the nose constant, or only associated with "colds", etc.? (Note: concomitant disease of the antrum of Highmore, frontal sinuses, etc., should be kept in mind). Describe in detail any so-called asthmatic attacks. Describe the character of the cough—paroxysmal, explosive, short, prolonged, loud, husky, stridulous, resonant, brassy. Is it accompanied with wheezing, expectoration, pain, nausea, whooping, crowing, aphonia, hawking, etc.? What is the character of the pain? When is it most severe, and is its severity increased by deep breathing, coughing, position, etc.? Is there superficial tenderness, and if so, what is its area? What is the quantity and character of the sputum? Is the sputum brought up in a large quantity at any particular time? What is its consistency, colour, transparency, and odour? Is it frothy or airless? Is it homogeneous, or does it settle in layers?

5. Is the pain in the back bilateral or unilateral, affected by movement, associated with tenderness, or with nausea, vomiting, burning or painful micturition? What is its intensity, and is it referred to the groin, bladder, end of the penis, etc.?

Ascertain the characters of the urine. Is it light or dark amber, almost colourless, dark yellow, red, smoky, milky, greenish, opalescent? Is there any peculiarity of odour? What is the character of the precipitate? Are there "threads" in suspension immediately after passing?
