

where it is not properly looked after, the abundance of seed which, by wind, can infest whole districts.

MENACE TO ALFALFA

On worn-out soils or in districts where alfalfa crop can be raised, the nuisance of sweet clover by its good qualities. But in good alfalfa clean farms and clean seed are essential. The seeders of sweet clover make it utterly impossible.

This is especially the case in districts where it looks promising or has already produced a crop.

The young sweet clover plant is very hardy. An average farmer will not be able to distinguish between the blossoms of the difference first between alfalfa and sweet clover where sweet clover grows as a weed. The farmer always runs the risk of having their alfalfa seed of course, that the alfalfa seed, however, is more or less sweet clover seed.

The seed of sweet clover is very hardy and in general appearance that even when mixed with alfalfa. This being the case, it is very likely, may put on the market alfalfa seed 'accidents' of this kind most numerous in the growing district and the alfalfa seed is the explanation.

The danger of getting alfalfa seed in irrigated districts. It will grow in ditches, and produce large quantities of seed and carried by the water all over the country. The irrigating waters has caused the west to look upon sweet clover as a menace.
