

Great Value
in Developing
Mining Property

Mining experts have pronounced the Carr System, of the greatest value in mining operations and transportation. Many properties at a distance from railroads await development for the want of a cheaper and more efficient method of handling their products.

Where required a very complete system of pipe line transportation, for gas, water and oil can be installed, with slight additional expense.

The interruption and danger caused by the breaking down of wires by the wind, sleet and ice, where overhead wires are used, is eliminated in the Carr System.

ELECTRIC CARRIER AUTOMATICALLY DUMPING ORE

This system provides a specially constructed Automatic Carrier for ores, coal, etc., for use within the mine, or over the mountain, and through the valley. Operations within mines, freight depots, factories, etc., are conducted on an adjustable, movable track, with carriers that automatically convey and deliver the load at any point desired, giving an immense advantage in time and labor over present methods.
