one. Truth About Canada.

for a large

up the bad egg is b

ined at home. It has become indispens able to moreco and kid divesors as well as to give manufactures. The proportion of had aggs coming into Chicago has been reduced to a minimum since the candiling system has come into vogue. This has-been reduced to almost a solence. Experts are required for the work. Before being shipped to the city market the aggs are taken into a dark room and examined in front of a candle. By this means any spots showing signs of decay are discov-ored and only good ones are sent to the market, thus saving the freight on poor stook, while the housewife is saved annoy-ance.

In the early days of the commercial his-tory of eggs farmers employed primitive methods for the preservation of eggs in store for the winter months, when the sup-ply is almost out off and the market price abnormally high. In January the price often used to run as high as 50 and 60 conts a dosen, while in the spring and dear as from 4 to 8 cents. The eggs were-packed in eats or sawdust and also in preserving fluids. This process was far from satisfactory. The preserving fluids had a tendency to weaken the shells. A process came into use by which the eggs were dried by artificial heat and ground up into the shape of meal for packing. Such egg meal found favor with bakers and was practicable for use on cocen ves-sols.

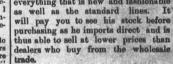

ries, to say nothing of large used at home. It has become
