

it rose to  $100^{\circ}$ .1F and throughout the case afterwards it remained at the normal standard in the morning, rising to  $99\frac{1}{2}$  at night. She was allowed to leave her bed on the 9th June and was discharged cured on the 15th June and left the hospital on that day.

CASE No. VIII.—Jane H., æt. 40, a rather tall but spare unmarried woman, was admitted into the Montreal General Hospital, June 1st, 1881. She is from the country, and as a girl had always enjoyed good health. Menstruation set in at the age of 18 and has always been irregular and rather scanty; in 1877 it ceased for three months, and she was treated for amenorrhœa. In August of last year she took cold and was again treated for this cessation of the menstrual flow. It returned in January last, but she was never certain as to time; the last appearance was on the 16th April last.

About July or August, 1880, she observed that her abdomen was swollen, but more on the right side. Since January last this tumour had rapidly and steadily increased. In April after the last menstrual period, she found her limbs swollen and œdematous, during the past six weeks the feet and legs have greatly increased in size, the skin being white and shining and pitting on pressure. For some months has suffered from frequent micturition and for the last six weeks has been much troubled in this respect. In September of last year and again in January, 1881, had some pain over abdomen, lasting for over a week, this was unattended by fever. This patient is of slight build, tall, very thin and presents that haggard appearance peculiar to ovarian disease. She prefers being propped up in her bed at night almost in the sitting posture, but says she can lie down. On examination abdomen found distended with a huge tumour, which yields a dull note everywhere. A number of superficial veins apparently enlarged, are seen coursing over the tumour.

The following measurements were taken :

From Symphysis Pubis to Xyphoid Cartilage.....	17 inches.
" Umbilicus to right Anterior Superior Spine.....	9 "
" " left " " " ".....	$10\frac{1}{2}$ "
" " right side vertebral column.....	$19\frac{1}{2}$ "
" " left " " " ".....	20 "
Girth of Abdomen, 2 in. above Umbilicus .....	41 "
