

*Museum.*—While there has been no large addition to any single department of the Museum this year, there have been considerable additions in several departments. The committees on Geology, Botany, Invertebrate Geology and Ornithology have done valuable work in their several departments.

*School of Science.*—A Summer School of Science was held during the first week of July under the auspices of the society, and was attended largely by teachers from the various parts of the Province. Practical instruction, both in the field and laboratory, accompanied the lectures and addresses on various branches of Natural Science given by several members of the society.

*Lectures on Science.*—Another important work undertaken by the society, and now in progress, is the course of lectures on Elementary Natural Science. They are conducted on the principle of the summer school referred to above. The series includes nineteen lectures on Chemistry, Mineralogy, Zoology and Botany, and thus far have been well attended.

In closing, the Council would express their thanks to the gentlemen who have prepared papers to be read before this society; and also to the city papers for publishing preliminary notices of the meetings.
