

medical profession. If every person who has been exposed to the risk of syphilis or gonorrhœa could be persuaded to report within an hour to a competent physician to receive effective prophylactic treatment, the prevalence of the disease concerned would be enormously reduced. It remains for the individual physician to adopt the standard of personal relation to the problem of prevention so ably set forth in the Manual<sup>1</sup> used by the United States Army Medical Corps. As an opportunity to give a few words of sound advice, to encourage a new clean point of view, to bring home a great moral principle, the moment when a young man appeals for rescue from the possibly disastrous results of an indiscretion has few equals in the practice of medicine.

*Conclusion.*—This chapter closes the study of the modern problem of syphilis and gonorrhœa. It has been the aim of the discussion to present the facts bearing on these diseases not alone as a medical issue for medical men, but as a problem in human nature and in the moral strength and weakness of the social order, in whose solution each and every one of us has his part. Though we may be spared the actual miseries of the sick, their pain must now be our pain, their struggle our struggle. Their defeat and death are symbols of our own futility. Only by such a socialization of our point of view toward the public health can we hope to advance beyond our present outlook and effectiveness. With the movement against germs and bodily disease must go a will to right spiritual wrong, an idealism for the body which is incomplete without the perfection of the soul. If we see the two as one, we have made the first step. If we as a race can feel our brothers' sickness as our own, their lacks our lacks, their triumph in flesh and spirit, our triumph, there is in us the stuff of destiny and there awaits us a future without finite limit.
