

Ageniella perfecta (Provancher).

Type male bearing yellow label "783" in the Dernière Provancher Collection, Public Museum, Quebec.

The type runs to *perfecta* in Banks' table (Jn. N. Y. Ent. Soc., vol. 19, 1912 (1911) p. 234) but differs from a specimen (in Banks' collection) determined as that species in the shape of the third cubital, which is larger and has the outer margin oblique (not curved) and the second recurrent is a little beyond middle.

Ageniella rufigastra (Provancher).

Type female bearing blue label "122" (script) and yellow label "1419" (printing) in Dernière Provancher Collection, Public Museum, Quebec.

This species has usually been considered a synonym of *congrua* Cresson, but the type differs from a homotype of *congrua* made by Banks (in coll. Banks) in the blackish hind legs and in the decidedly postfurcal nervulus.

Episyrion griseus (Provancher).

Provancher's type is a male, not female, and is in the Dernière Provancher Collection in the Public Museum of Quebec, bearing a yellow label "1011" on pin.

This species is related to *biguttatus* etc., but may be distinguished by the angulate posterior margin of pronotum and absence of markings on the abdomen. The abdominal markings are, however, not constant, and specimens from Canada (Baker collection) in the National Museum, which have the posterior margin of the pronotum angulate but have two lateral spots on the third tergite, have been placed under Provancher's species.

Pompiloides apicatus (Provancher).

Type female bearing yellow label "769" in Dernière Provancher Collection, Public Museum, Quebec.

The following notes may aid in the determination of this species. Propodeum shining with a distinct median furrow; second and following tergites with appressed pile; nervellus postfurcal; first intercubitus strongly curved; third intercubitus
