

pation, the putting up of cave-troughs, climbed ladders, and moved about upon the roofs of buildings. The range of motion at the astragalo-crural joint is about 25 degrees.

CASE 2. F. B., aged 16, double club-foot, congenital and strongly marked, fasciotomy and tenotomy much as in the former case.

August 6th. Further correction made.

Fig. 3, Case 2.

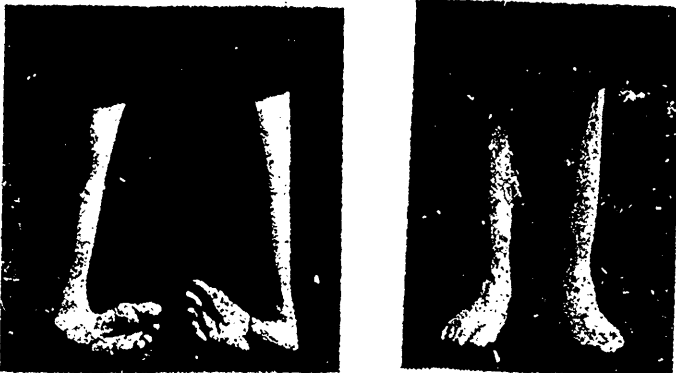

Fig. 4, Case 2.

September 1st. Further correction made.

October 6th. Tendo-Achillis cut, and both feet brought to an angle of 90 degrees dorsiflexion. One dressing subsequently, without anesthesia, brought the feet to 80 degrees of dorsiflexion.

November 19th. Began walking, using boots and a cane. This latter thrown aside in two weeks.

April, 1900. At the present time, walks well and suffers no
