

the work has been thoroughly done by employing a mixture of lime-wash and carbolic acid in the proportion of one pound commercial carbolic acid to five gallons of lime wash. The soil of yards and corrals, in which diseased cattle have been kept, should either be ploughed and thoroughly saturated with a solution of some reliable disinfectant, or well sprinkled with fresh lime.

Too much care cannot be exercised in dealing with any of the forms of disease produced by mange *acari*, as they are insidious to a degree, and frequently reappear after all danger is thought to be passed.

OTTAWA, August, 1911.

J. G. RUTHERFORD,

*Veterinary Director General and Live Stock Commissioner.*
