Winnipeg Branch: N. C. Leslie, Manager.

of success on rough and ill-made roads; but where highways are as intelligently engineered and as thoroughly well built as those on which the trials at South Orange were made, or where Nature has relieved the engineer and the road builder of the expensive work of grading, as throughout a very large extent of the western and southern portion of our country, we may expect to see the road locomotive rapidly introduced.

The earliest and most perfect success of the traction engine, and its probable successor, the steam carriage, may be expected to occur in those districts. Its great economical advantage over animal power, as exhibited above; its freedom from liability to become disabled by epizootic diseases; its reliability under all circumstances, and the many other advantages which are possessed by the machine, are already securing its rapid introduction, despite the difficulties arising from popular prejudice and unfamiliarity, from hostile municipal laws, and other existing obstacles.

We are learning that this motor, when it can be used at all, is comparatively inexpensive; that our roads are improved by it, and that the ancient idea of its conflicting with the interests of owners and workers of horses, is only a superstition.

We have found by our experience with the steam fire engines, with the elevated railroad on Greenwich street, New York, and with railroads throughout the country, that the frightening of horses is but a temporary and a comparatively insignificant inconvenience. It would seem to the engineer that the natural obstacles generally supposed to stand in the way have, after all, no real existence.

The principal inconvenience that may be anticipated will probably arise from the carelessness or avarice of proprietors, which may sometimes cause them to appoint ignorant and inefficient engine drivers, giving them charge of what are always excellent servants but terrible masters. Nevertheless, as the transportation of passengers on railroads is found to be attended with less liability to loss of life or injury of person than their carriage by stage coach, it will be found, very probably, that the general use of steam in transporting freight on common roads may be attended with less risk to life or property than to-day attends the use of horse power.

This great economical revolution has now made a fair start, and is progressing with most encouraging rapidity. We may anticipate its complete success at no distant period. Meantime every member of the engineering profession may aid its progress by exerting a personal influence in favor of the improvement of our roads and the further improvement of the road locomotive, which has, as we have shown, at last assumed a practi-
