

LIST OF TABLES (continued)

<u>Table Number</u>		<u>Page Number</u>
3-9	Characteristics of map classes for the eastern United States as to the potential to reduce acidity of acidic deposition.	3-43
3-10	Formal names, locations, lake data sources and the laboratories that analyzed data.	3-54
3-11	Regional water chemistry survey results for surface water pH distribution.	3-58
3-12	Summary of the percentage of lakes and streams in each alkalinity class by county or district for Ontario.	3-61
3-13	Some statistics on the ratios of $\text{HCO}_3^-/\text{SO}_4^{2-}$ for waters of Quebec.	3-69
3-14	Mean concentrations of ions in the water of four Nova Scotia rivers.	3-78
3-15	Apparent changes in summer pH values in lakes in Nova Scotia and southern New Brunswick during the period 1940-79.	3-82
3-16	pH of streams in Muskoka-Haliburton, Ontario.	3-95
3-17	Monthly discharge hydrogen ion loads and percent of annual total.	3-96
3-18	Spring/summer comparison of average parameter values.	3-99
3-19	Susceptibility of breeding habitat to pH depression for amphibians whose range overlaps areas receiving acidic deposition.	3-110
3-20	Approximate pH at which fish in the LaCloche Mountain Lakes stopped reproduction.	3-114
3-21	Metals residues in yearling yellow perch.	3-125
3-22	Distribution and frequency of occurrence of fish species collected during surveys of Adirondacks Lakes.	3-128
3-23	Summary of biological effects observed.	3-140
