There is no truer indication of lack ful methods followed are to cut the of proper shepherding than failure to dock and castrate lambs. No matter the body, or the emasculators may be how good a feeder and caretaker used. rwise a man may be, he is a failure as a shepherd if he neglects these important duties. It is a piti-ful sight in the autumn to see ram lambs keeping the females continually on the move, not only bosing flesh themselves, but hindering the entire flock from making satisfactory gains. Contentment and quietness are essential in a flock. The buyer goes to the neglected flock only when forced to because properly handled flocks are

Whether it is rush of work in the spring of year, fear of fatalities, lack m or just carelessness on the part of the shepherd it is difficult to state, but the fact remains that in time as it is cut. This is a sanitary a great many flocks castrating and docking are left undone. These combined reasons do not justify neglecting these two important tasks. The sheepman will find very little employment that will compensate him bet-ter than docking and castrating. The operations are simple and easy to arn. Carelessness is no excuse and the owner, if pursuing haphazard methods, had better dispose of his flock as it is more than likely a balis frequently the cause of maggets ance will show on the wrong side of his ledger. Stockmen generally con-demn those who fail to castrate horses, cattle or hogs and why should not the shepherd likewise be severely The lamb is the easies criticized? to unsex of the common domestic

The best age to castrate is about two weeks. A sharp knife should be used and with it the lower third of the scrotum cut off. Then sever the immediate coverings of each testicle and draw them out with attached cord, using the teeth or fing-Wash the opening with a weak antiseptic solution. Some operators do not sever the bottom part of the scrotum but this is advisable and al-

# **FENCE**

MADE BY THE Canadian Steel & Wire Co.

A sound, substantial, enduring fence, built on elastic, hinged-joint principle—the most scientific, practical and perfect fence principle known. It yields to great and sudden pressure but returns again to the original shape.

Thoroughly galvanized and protected against weather.

FORSALE BY

ALL GOUD DEALERS

Ask for prices. They are attractive.

It pays the sheep owner to have his lambs castrated. Wether lambs sell at a premium above ram lambs. They make better gains as they are more restful. They do not anmoy the ewes, are easier fenced and if there is no sale for them in the fall they may be kept over and sold as shearlings, whereas it is next to impossible to de this with any number of ram lambs If the buck lambs are not castrate the danger exists of having the bes ewes bred to poor ram lambs.

Docking lambs may be done with sharp knife or chisel. A good plan use a long-handled, red-ho chisel and sear the tail at the same method and assists in controlling bleeding. The proper age for this operation is the same as that for castrating, and, while it may appear like severe treatment, both jobs be done at once. An inch stub for males and two-inch for females look well. Half-tailed lambs are almost as

unsightly as undocked lambs.

Docking should not be negle locating on the hips and rumps of lambs. Ociasionally the ma cakes and stops the action of the bowels. Docking improves the com-pact appearance of the lambs and is a sign of good management. Docking conserves the strength of the ram by facilitating the breeding of the ewes.

Potato Scab.

Common Scab .- This, as the nam by which it is known implies, is one of the most common troubles affecting potatoes. Although the occur rence of scab does not, as a rule, affect the yield, it detracts considerably from the value of tubers for both seed and commercial purposes. value is affected owing to the fact that the eyes of badly scabbed tubers are likely to be injured thereby, and the unsightliness of scabbed tubers combined with the considerable trouble and waste entailed in preparing them for the table, renders them undesirable for domestic use.

A discouraging experience frequent that, notwithstanding the use of perfectly clean and sound tubers for seed, a considerable percentage of scabbed potatoes is in evidence at harvest This is due to the fact that the scab organism occurs naturally in the soil, particularly if alkalinity has been increased by the application of wood ashes, lime, fresh manure, or other substances of an alkaline nature. As an instance, it frequently occurs that where potatoes are planted on land which has recently been cleared and burnt over, or where they are planted immediately after an application to the land of fresh barnyard manure, the result is a scabbed crop. On the other hand, it has been found that the plowing under of green crops, such as clover, has a tendency to decrease the liability of injury from the disease.

the disease.

The potato crops should be included in a rotation so planned as to allow blooming stage, the old underground from the underlying soil in as thin paign against flies at once.

Change sheep very grad toes. This practice, combined with already beginning to die. So don't if the ground is moist, run a disk try to kill the old underground stems harrow, with disks set straight with formaldehyde or corrosive sublimate, while not providing a guarantee that a crop of potatoes will be they die anyhow. free from scab, constitutes a reason able safeguard against its occurrence.

The following points should be particularly borne in mind at planting

(1) Plant only clean tubers. (2) Disinfect seed by immersing it for two hours in a solution of commercial formalin-1 pound to 40 gal-

lons of water, or (3) For 3 hours in a solution of corrosive sublimate (bichloride of mercury)—2 ounces to 25 gallons of

(4) Use only wooden or earthen

ware vessels for corrosive sublimate. (5) Corrosive sublimate is intense ly poisonous. All tubers treated with this, and left over after planting is completed, should be immediately destroyed.

Powdery Scab.—This disease differs considerably in appearance from Com-mon Scab. The scab spots are darker in color and usually more uniform in size and shape. It is not so common or widespread as Common Scab, and usually occurs only in damp, cool

Potatoes affected with Powdery every case all seed which has come in contact with any tubers showing the disease, should be treated with corrosive sublimate. As the organism is known to live for several years in the soil, potatoes should not be plant ed on the land where it has occurred for at least four years.

# Experience Counts

You can't afford to neglect fertilizers this year.

Here are their advantages:

Fertilizers:

(1) pay your money back with (4) hasten ripening.
(5) eliminate to a

(2) increase yields. (3) improve quality.

(5) eliminate to a large ex-tent crop failures. (6) help banish weeds.

nie par cha nieu meku ande ek ek ek ek ek e

(7) cut down labor costs.

Last summer \$1 invested in fertilizer for potatoes growing near London returned in one case \$2.94 and in another \$4.5%.

Figure your needs, and place your orders at once so that you can receive fertilizers in time for seeding.

#### The Soil and Crop Improvement Bureau

Henry G. Bell, B.S.A., Director, 14 Manning Arcade, Toronto, Ont.

#### Killing Quack-Grass

Quack-grass produces stems under-| bloom, get out the mower and go ground as well as above ground, These

underground stems have joints in them, with a bud at each joint, just as do the stems above ground. And it is the underground stems that make quack-grass a bad weed. Every bud on such stems can throw up a new plant. Every time one of the under ground stems is broken with a plow of cultivator, you have a new plant be ginning from the part broken off. The Time to Strike and the Reas

If you dig into a quack-grass sod in early spring, you will find great numbers of underground stems. At the approach of warm weather some of the buds on these stems begin to grow straight up to the surface. There they throw out a ring of real roots and form a crown from which a lot of leaves and stems grow. But at this time of the year all the stems that come out of a crown grow upward and no new underground stems are formed until the plant begins to

Then while the plant is in bloom, a ew crop of underground stems begins to grow. All these stems come out of the crown, just as the stems that grow upright, and never form any other part of the plant. If the grass is cut for hay at exactly this time, the growth of underground stems is completely stopped for a few weeks. The plant can not produce ly encountered by potato growers is underground growth without a lot of leaves up in the sunlight; and if the plant has been cut while in bloom, it immediately begins to throw all its energy into the production of new leaves and stems above ground. This fact is very important, as we shall

> It is also of very great importance that, by the time the plant blossoms the old underground stems have done their lifework, which was to throw pay any attention to them.

Some farmers make the mistake of trying to kill the underground stems early in the season. This is almost a useless task, for at that time of the year every joint of these underground stems can make a new plant. But during the fall before planting pota- do not need killing then, for they are dry, this will kill the grass completely. of quack-grass. They can't be killed before midsummer, and after that

In order to tell when quack is in bloom, watch it carefully till you see the blossoms open, and the anthers hanging out of the flowers on slender This will be about two or three weeks after the grass heads out. When the earliest plants begin to this way.

Suppose now we let the grass grow undisturbed until it begins to stems are done, and need no further attention; and there is no se growing plants. If we cut the grass for hay just at blooming time, we can feed the hay with safety, for it will scatter no seed over the farm. The cutting also stops the formation of new underground three weeks. There is thus a period of nearly a month, just after having time, when quack-grass is not a weed at all. By that I mean that it has no means of reproducing itself except by growth from the crown. It is as helpess as a field of young oats, and can be killed just as easily.

If the weather is dry, the over-turned sod will die promptly, and the work of eradicating the quack is finished. But if the season is wet, you will need to run a disk-harrow, with the disks set straight, across the strips of overturned sod. The harrow will cut the sod into small squares After this, go once over the field about every ten days, using some implement that will move every piece of sod just enough to keep it from getting its up new growth to the surface of the roots into the underlying soil again They are through; and will before cold weather. A springgradually die during the latter part harrow is excellent for such stirring of the summer. You do not need to of the sod; but any tool that will move the sods about will do. growth is prevented until the end of summer, there will be no quack on the field the next spring.

To Sum Up.

Cut the quack for hay while it is harrow, with disks set straight crosswise of the strips of upturned sod, to cut it into squares. Then to prevent the sed from getting its roots into the underlying soil again, stir the pieces of sod every ten days till frost. A spring-tooth harrow, or any cultivator will do for this. The field will be clean of quack-grass the next spring. Many fields have been cleaned

### The Sunday School Lesson

APRIL 24.

Poverty and Wealth Isaiah 5: 8-10; Amos 8: 4-7; St. Luke 16: 19-25. Golden Text-St. Luke 12: 34.

Connecting Links—Where social and economic conditions are such that men who work hard and long do not earn enough to keep themselves and their families in comfort, to feed and clothe and educate their children, there is evidently something wrong. This is especially true in a land like our own, a land of abundant resources. It is folly, in this country of free people and free democratic institutions to blame the few who have gathered wealth or to talk revolution. The remedy lies with ourselves, in careful, patient effort to discovere the causes of inequality and injustice and poverty, amd when discovered to remove them. Is not one of the chief causes of poverty and unemployment the

remedy lies with ourselves, in careful, patient effort to discover the causes of inequality and injustice and poverty, and when discovered to remove them. Is not one of the chief causes of poverty and unemployment the crowding of multitudes of people into the cities, when our fields, our forests, our fisheries, and our mines cannot find enough laborers? Does not the remedy for Canada, in very large part, lie in more and still more production, and, therefore, in the engaging of more and still more workmen in our great productive industries? And it will lie with our government to provide by law that there shall be a fair and an adequate recompense to every honest worker, and restraint or compulsion of some sort for both the idle loafer and the busybody.

Isa. 5: 8-10. Wee unto them. The prophet, living more than seven hundred years before the birth of Christ, sees the injustice of his time and is filled with a passion for reform. Especially is he disturbed by the fact that the land seems to be passing out of the hands of its original owners, in the free men of Israel, into the possession of a few great nobles or rich men. Henceforth they who had been their of the land, become practically slaves or leave their poor homes to find a markets of the city.

Isaiah foresees trouble coming upon the rich land-grabbers, whose insatiable lust for more would seem to indicate that they wished to dwell alone in the midst of the earth. A foreign enemy, the Assyrian, will soon invade the country, and their fine houses shall be left desofate, and their vine in the making or in the possession of wealth. Rather dose it commend industry, and thrift, and right way of making wealth and their vine houses shall be left desofate, and their vine would fine many of wealth. Rather dose of the carth, and their vine houses shall be left desofate, and their vine houses shall be left desofate and their vine and industry, and thrift, and right way of making wealth and the vill gain.

How to Strike.

To eradicate the pest completely, at this time, all we have to do is to kill the growing crowns of the plants. The best way to do this is to skin the sod loose from the underlying soil in as thin a layer as possible—say not over three or three and ome-half inches thick. This can be done by plowing with a broad, sharp share that will cut the sod entirely loose from the Many St. 4-7. Hear this, Amos, like

did not minister to him.

The Bible does not teach that evil lies in the making or in the possession of wealth. Rather does it commend industry, and thrift, and rightful gain. What it condemns is wrong ways of making wealth, and the wrong and selfish use of the power that wealth gives.

Application.

Many diseases which were once thought incurable are now often treated with such skill that the patients

ed with such skill that the patients recover. A distinguished medical man said recently that the term incurable ought never to be applied to any dissoil beneath. Deeper plowing will leave too much dirt attached to the roots, and the plants will go right on growing. The idea is to have as little dirt in the turned sod as possible—thence the shallow plowing.

If the weather is dry, the over-live and the property of the roots and the plants will go right on growing. The idea is to have as little dirt in the turned sod as possible—thence the shallow plowing.

Amos 8: 4-7. Hear this. Amos, like ease. So it is in regard to social diseases; we have too long regarded which was so prevalent in his time, and unscrupulous able. It is not so, and one of the tasks awaiting an earnest church is too show that poverty is no more interested and will all the poor. It seemed, indeed, as if they would destroy poor men out of the evitable than were many physical distance. which was so prevalent in his time, the immoderate and unscrupulous seeking of gain, and the preying upon the poor. It seemed, indeed, as if they would destroy poor men out of the land, so greedy were the rich landlords and traders for more and more. New Moon and Sabbath were holy days set apart for rest and worship. These traders are impatient of the cause.

> leg bathed three times a day with vinegar and cold water or with a mild astringent lotion prescribed by the veterinarian. One attack subjects the horse to another.

buy or make a fireless cooker.

#### Planting Strawberries.

Plant strawberries in the spring as soon as the soil is in good condition work. Procure plants from a reliable party, and if they are a little wilted when you get them, they should be heeled in very thin in the row and shaded from the sun until they freshen. Before heeling in cut off one-third of the roots evenly and leave three or four leaves. Cloudy weather is considered best for planting, although if your plants are in good condition, the forenoon and afternoon of clear weather is safe enough.

Every school child must have a hot Screen your home. Start the cam- dish at moon to supplement the lunch brought from home. Cafeterias are becoming the rule rather than the exception in our city schools, and all Get the oil stove in readiness, and up-to-date rural schools are adoping the hot lunch at noon.
