

Fill in the dimensions of the barn you are going to build. Cut out this illustration and mail it to us. We will quote you prices laid down at your nearest railway station.

"Eastlake" Steel Shingles and "Metallic" Corrugated Iron

have no equals for barn building. You know the main points to consider when building a barn:

Safety First.—Safety against fire, lightning and storms.

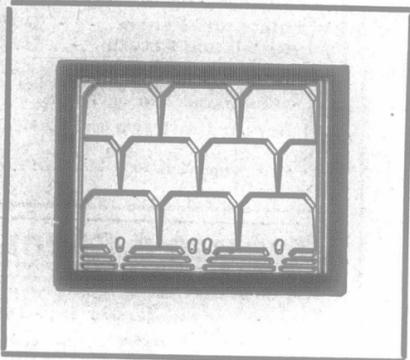

Economy Second.—First cost of materials must not be high.

Upkeep Third.—Painting and repair bills must be "cut out" altogether.

Durability Fourth.—The barn must "live" as long as the man who builds it.

"Metallic"-built barns are **safe, economic**; require **no upkeep** expenditures and are more **durable** than wood, or any other method of construction at the same price.

Therefore, get the cost of barn building with "Metallic" materials—send in your specifications.

This is an "Eastlake" Steel Shingle

The "Eastlake" is made of the best obtainable steel—zinc coated on both sides. Every "Eastlake" Shingle is perfect, there can be no errors in laying. Any intelligent person can cover a roof with "Eastlake" Shingles.

You save many dollars in labor, because it takes less time to lay "Eastlake" Shingles. Patent counter-sunk cleat and patent side lock and gutter are big features in the "Eastlake"—perfect drainage and no warping.

"Metallic" Corrugated Iron—Different from other corrugated iron. Better galvanized. Each corrugation deeper, giving greater rigidity. Corrugations are made separately and accurately, ensuring a perfect fitting overlap.

Remember, that the sides of your barn should not look unsightly, and should have the maximum of strength and weather-resisting quality.

We Will Give You the Greatest Value for Every Dollar You Invest in a Barn

By sending a diagram or drawing, you get the cost of "Eastlake" Zinc-Coated Shingles, which can be laid by any local workman. If you finally build with these materials, you make a barn that is clean, and that needs no paint or repairs. You add \$500 to \$1,000 on the selling value of your farm by having metal instead of wood.

You will get an estimate on the only proven metallic shingle roof, where 29 years of service can be shown on roofs with the same pattern of shingle and material that you will have. No other metal roof has been made this length of time in Canada, though one maker of metal roofs had been in business in other lines, commencing to make shingles seven years after we had started as pioneers. No metal shingles were made in Canada prior to 1884, when we started the first Canadian factory. If you write to-day, you are taking the first step to adopt the new economical way to build barns under modern conditions, instead of sticking to methods which were economical in their day, under conditions that no longer exist.
