THE BEST REMEDY

Diseases of the Throat and Lungs.

ples and curative virtues of the finest drugs, chemically united, of such power as to insure the greatest possible efficiency and uniformity of results. It strikes at the foundation of all pulmonary diseases, affording prompt relief and rapid cures, and is adapted to patients of any age or either sex. Being very palatable, the youngest children take it readily. In ordinary Coughs, Colds, Sore Throat, Bronchitis, Influenza, Clergyman's Sore Throat, Asthma, Croup, and Catarrh, the effects of Ayer's Cherky Pecroral are magical, and multitudes are annually preserved from serious illness by its timely and faithful use. It should be kept at hand in every household for the protection it affords in sudden attacks. In Whooping-cough and Consumption there is no other remedy so efficacious, soothing, and helpful.

Low prices are inducements to try some of the many mixtanes, or syrups, made of chear and inteffective ingredients, now offered which, as they contain no curative qualities can afford only temporary relief, and are sure to deceive and disappoint the patient. Diseases of the throat and lungs demand active and effective treatment; and it is dangerous experimenting with unknown and cheap medicines, from the great liability that these diseases may, while so trified with become deeply seated or incurable. Leave and the sease of the throat and lungs demand active and effective treatment; and it is dangerous experimenting with unknown and acknowledged currity epower, and is a standard medical preparation, of known and acknowledged currity power, and is a standard medical preparation, of known and acknowledged currity power, and is a standard medical preparation, of known and acknowledged currity power, and is a standard medical preparation, of known and acknowledged currity power, and is a standard medical preparation, of known and acknowledged currity power, and is a standard medical preparation and fine integrations with allow. Emiment physicians knowing its composition, prescribe it in their proven its absolute cert

It is claimed that Johnson's Anodyne Link in the cure of diphtheria, pneumonia, influenza, pronchi-in sheridant in the cure of diphtheria, pneumonia, influenza, pronchi-in decreption that along packs and cost more more money in a large packs. Sheridan's Condition Products an a flower are arranged in circles takes part in the action, and from about an axis. The outer circle consists generally of green leaves, the sepals forming the calyx; the consists generally of green leaves, the sepals forming the calya; the next circle is generally of a different color and forms the corolla of the flower, its seperate leaves being the Petals. These two sets of leaves are not essential to the formation of early separate of seed and are indeed absent in some flowers. Their purpose is to protect the more delicate inner parts and later to attract insects, &c. Inside the corolla are the stamens of which there may be many circles as in the Rose. The stamens consist. which there may be many circles as the actions. Thus, the supply of in the Rose. The stamens consist usually of little stalks crowned with the arthers, sacs containing the Polled dust. The centre is occupied by the Pistil which consists generally of three parts, the Ovary, a hollow the plants could use the nitrogen that plants the nitrogen that plants the nitrogen that plants the nitrogen that plan

interier of the ovary and are so connected with the plant that they can receive nourishment from its tissues. The mode of attachment can easily be studied in the seed, as in a Bean or Pea. In order that these ovules may develope into seeds they must be fertilized, i. e. a grain of pollen must fall on the atigma, protrude a tubular prolongation down through the style until it comes in contact with an evule. If this does not take place the flower produces no fruit. Now, some species have the flowers, and some even on separate plants, so that some agency is necessary to carry the pollen from one flower or plant to another. Wind, insects, birds, &c., are the various means. There is a general tendency in nature for flowers to be so arranged that ovales of one flower; shall always be fertilized by pollen from another, so as to prevent close breeding which seems to have a deteriorating effect in plants as in animals. Effective as are the natural devices for the feetilization of the

al devices for the fertilization of the female flowers it is sometimes useful and animals generally, so that the

part of the plant capable of producing a bud is also espable of taking root and growing, when separated from the parent stem and placed under proper conditions.

The case of the willow is familiar.

The processes of "layering," propagating by means of shoots, suckers, slips, &c., all depend on this fact.

The readiness with which plants could be propagated in one or more of these ways if the right conditions of moisture, temperature, &c., were observed.

The nutrition of plants is next to occupy us for a few moments. By nutrition is meant the taking, diagrams, and carrying to the tissues, of the plant's food. The plant takes its food in two ways and from two sources. Referring back to a previous lecture we rengember that have been until the plant is built up of carbon, hydrogen, oxygen, nitrogen, sulphur, phosphorus, with small quantities cause of the wonderful luxuriance is subscience.

OFFERS the best field for Emigrants, viz.: a mild, squable, and healthy climate; cheap lauds of great fertility, producing all varieties of Grain, Fruit, and Grasses in wonderful abundance; an inexhaustille supply of Timber; vast Coal Fields, and other mineral deposits; cheap and quick transportation by railroads and river navigation; direct commerce with all parts of the world, owing to its proximity to the Pacific Ocean.
