

SURGICAL SHOCK

is reduced to a minimum by high rectal injections of **BOVININE** combined with an equal quantity of salt solution to render absorption more rapid. It should be heated to 70°F, and administered prior to, during, and subsequent to operation. The quantity should be suited to the individual case, varying from two to six ounces of each.

Bovinine

improves the heart action and circulation at once; its sustaining effect is continuous for two to three hours.

The blood which has become non-aerated through ether administration is oxygenated by the introduction of a fresh supply, and is rapidly restored to normal condition. To this fact is due the power of **BOVININE** to prevent the thirst, nausea, and emesis, which usually follow anæsthesia.

Its wonderfully nourishing, supporting, and healing properties render it a necessary adjunct to the operating room.

Reports of numerous cases are cited in our scientific treatise on Hæmotherapy. It is yours for the asking.
