

## LIST OF TABLES

| <u>Table No.</u> |                                                                                                                                                                 | <u>Page No.</u>  |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| 2-1              | Summary of global sources, annual emission, background concentration, major sinks, and residence time of atmospheric gaseous pollutants.                        | 2- 5             |
| 3-1              | Concentrations in bulk deposition and total bulk deposition of four ions, at four calibrated watershed studies.                                                 | 3-10             |
| 3-2              | Comparison of mean pH and excess $\text{SO}_4^{2-}$ concentrations from the mid 1950s to 1973, for six rivers in Nova Scotia and one in Newfoundland.           | 3-12             |
| 3-3              | The uptake of nitrate, ammonium ion and total nitrogen by forested watersheds in three calibrated watershed studies.                                            | 3-26             |
| 3-4              | Annual budgets of bulk precipitation inputs and stream-water outputs of dissolved substances for undisturbed watersheds of the Hubbard Brook Experiment Forest. | 3-30             |
| 3-5              | pH of streams in Muskoka-Haliburton, Ontario, Canada: Stream pH is given prior to spring runoff (mid-March 1978) and a maximum runoff (mid-April 1978).         | 3-32             |
| 3-6              | Summary of total cation release, hydrogen production and the cation release ratio for five manipulated-watershed studies.                                       | 3- 36            |
| 3-7              | Potential increase in cation leaching expected under three precipitation acidity regimes.                                                                       | 3- 37            |
| 3-8              | Susceptibility of breedings habitat to pH depression due to acid precipitation for those amphibians in Canada whose range overlaps the impacted area.           | 3- 50            |
| 3-9              | Approximate pH at which fish in the LaCloche Mountain Lakes stopped reproduction.                                                                               | 3- 54            |
| 3-10             | Distribution and frequency of occurrence of fish species collected during surveys of Adirondack Lakes >610 metres elevation.                                    | 3- 58            |
| 3-11             | Avian and mammalian species susceptible to the effects of acid precipitation.                                                                                   | 3- 65            |
| 3-12             | Illustrative dose/response/time relationships under selected loading patterns.                                                                                  | 3- 86 &<br>3- 87 |
| 3-13             | Summary of the percentage of lakes in each alkalinity class by county or district and for Ontario                                                               | 3- 92            |
| 4-1              | Effects of long-term controlled ozone exposures on growth, yield and foliar injury to selected plants.                                                          | 4- 3 &<br>4- 4   |
| 4-2              | Representative tolerance limits to simulated acid precipitation.                                                                                                | 4- 6             |
