

Some Scientific as well as common sense reasons why Expanded Metal is better than any other system of Concrete Reinforcement.

Manufactured from best open hearth steel.

Method of making increases elastic limit and every sheet tested in the making.

Gives a uniform distribution of small sections at frequent intervals, preferable to larger sections at greater intervals.

Every ounce of metal is working and giving maximum tensile strength for sectional area of metal used.

The strand can be cut to suit any sectional area required giving the Architect and Engineer exactly what he wants without waste.

The sheet being solid (not soldered or woven) a steel bond is provided for the concrete slab, the strands being in tension in all directions.

Expanded Metal is "Fool Proof." Loose rods depend on the care taken by workmen to place, and keep same placed, at proper distances apart.
