

This micrograph shows a cross-section of a polymer blend. A vertical line indicates the interface between two different polymer phases. The left side is a lighter, smoother region, while the right side is a darker, more textured region. The interface appears relatively clean and well-defined.

A close-up photograph of a textured surface, possibly a book cover or endpaper. The surface is light-colored with a fine, woven texture. A vertical crease or fold runs down the center. Two dark, irregular spots are visible on the right side of the crease. The lighting is somewhat uneven, with a darker area on the right edge.
