

learned that it never arrived nearer to maturity than just to blossom ; after which it appeared blighted, and died away. This convinces me that the north-west wind, as I have before hinted, is much more powerful in these than in the interior parts ; and that it is more inimical to the fruits of the earth, after it has passed over the lakes, and become united with the wind which joins it from the frozen regions of the north, than it is further to the westward.

**BEANS.** These are nearly of the same shape as the European beans, but are not much larger than the smallest size of them. They are boiled by the Indians, and eaten chiefly with bear's flesh.

The **SQUASH.** They have also several species of the **MELON** or **PUMPKIN**, which by some are called squashes, and which serve many nations partly as a substitute for bread. Of these there is the round, the crane-neck, the small flat, and the large oblong squash. The smaller sorts being boiled, are eaten during the summer as vegetables ; and are all of a pleasing flavor. The crane-neck, which greatly excels all the others, are usually hung up for a winter's store, and in this manner might be preserved for several months.

## APPENDIX.
