

the requirements of the practitioner, and associated anatomical facts with those conditions, resulting from injury or disease, that these facts elucidate, presenting, in connection with each organ or system, enough facts illustrative of the dependence of the diagnostician and practitioner upon anatomical knowledge to awaken interest and to combat the tendency to regard anatomy as something to be memorized during student days and forgotten when examinations are over. Even when such facts do not seem at a first glance to come within the scope of a text-book of anatomy, it will be found that a careful comparison of this text with the descriptive portion of the book will show a real and practical relation between them-- a relation which, once established in the minds of the student and the physician, will make it easier for the former to learn his anatomy and for the latter to remember and apply it."

A review of this would not be complete without some special mention be made of the illustrations in which evidently no expense has been spared and it should be noted that "in almost every case special dissections or preparations were made, and the drawings taken direct from nature, giving faithful, honest, conscientious reproductions, resulting in the most remarkable, accurate, and artistic anatomical illustrations.

We have no hesitation in strongly recommending this work to the student, general practitioner or specialist.

HARRY MORELL.

BOOKS RECEIVED

The following have been received and will receive consideration later:

Gynaecological Diagnosis. Edited by JOHN G. CZARK, Univ. of Penn. Six hundred and seventy pages of text, with three hundred and forty-six illustrations and four full page plates in black and colors. J. B. Lippincott Co. Philadelphia, London and Montreal.

Diseases of the Digestive Canal. By DR. PAUL COHNHEIM. Edited by DUDLEY FULTON, M.D., Univ. of California. Nearly
