PERIODS OF SOWING.—The time when our common cultivated fruit trees exhibit the petals of their flowers, is, with few exceptions, the proper season for sowing garden seeds in open culture. Dry weather is the best for sowing, because the earth is in a crumbling state, fit to receive the seeds, instead of clogging around them, and when the rake, or other instrument for pulverizing the soil, can be used with most effect. With regard to the depth necessary to cover seeds, experience teaches the gardener better than any fixed rule which can be given. It is a mistake to suppose that all kinds of seeds must be well buried, in order that the young plants may have a good hold of the ground, because seeds, in general, when they begin to grow, plunge their roots downwards, and throw their stems upwards.
