Sawdust for Bedding.

We have tried for two years. sawdust in the cow stable, and on whole like it better than any bedding we have ever tried. It makes a more comfortable bed, with less labor than when any other is used. The objection to salt-marsh sods, dried, or to headlands and dry muck, is that they soil the cow, and make it necessary to wash the bag before milking. Straw, of all bag before milking. Straw, of all sorts, soon becomes foul, and withhired man is likely to bestow, soils out more care than the ordinary the cow's bag also. Dry sawdust is clean, and makes a soft, spongy bed and is an excellent absorbent. The bag is kept clean with the aid of a coarse brush, without washing. A charge of fifteen bushels in common box-stall, or cow stable, will last a month, if the manure dropped upon the surface is removed daily. The porous nature of the material admits of perfect drainage, and of rapid evaporation, of the liquid part of the manure. of the liquid part of the manure.

The sawdust is not so perfect an absorbent of ammonia as muck, but it is a much better one than straw, that needs to be dried daily, in the sun and wind, to keep it in comfortable condition for the ani-mals. In the vicinity of saw and shingle mills, and of ship-yards, the sawdust accumulates rapidly and is troublesome waste that mill-owners are glad to be rid of. If it can be had for the carting. But even if it were sold at one or two cents a bushel, a common price, it makes a very cheap and substantial bed-ding. The saturated sawdust makes an excellent manure, and is so fine that it can be used to advantage in drills. It is valuable to loosen compact clay soils, and will help to retain moisture on thin, sandy and gravelly soils. There sandy and gravelly soils. There is a choice in the varieties of sawdust for manure, but not much for bedding. The hard woods make a much better fertilizer than the resinous timber. To keep a milch cow in clean, comfortable condition, we have not found its equal.
