

Nothing Left to Chance

In the preparation of *Parke, Davis & Co.'s Anti-diphtheritic Serum* the element of guesswork never enters. Modern scientific methods mark every step in the process of production.

The biological stables are under the constant supervision of a skilled veterinary surgeon. They are provided with an abundance of light and fresh air and a perfect system of drainage.

Before admission to the stables each horse is subjected to a rigid physical examination. The tuberculin and mallein tests are applied to exclude tuberculosis and glanders. The animal is kept for ten days under strict surveillance in an isolation stable and rendered immune to tetanus by treatment with antitetanic serum.

In the processes of treatment with diphtheria toxin and of abstraction of blood all appliances are carefully sterilized. The toxin is injected and the blood withdrawn in accordance with the best methods of aseptic surgery.

The product is marketed in hermetically sealed glass bulbs, and every lot is physiologically and bacteriologically tested.
