

When properly made, the extract and diastic extract of malt not only contain all the nutritive substances of malted barley, but also a peculiar ferment (diastase), which has the power of converting starch into the soluble form, thus assisting in the digestion of amylaceous food. Extract of malt is a valuable food in concentrated form, and is easily assimilated. Liquid malt is made by fermentation, several varieties being sold, varying in alcoholic strength from the smallest traces to eight or ten per cent. A good liquid malt is a valuable remedy in cases of general debility, deficient digestive power or loss of appetite. It is probably one of the best agents for increasing muscular tissue and augmenting fat, many persons gaining considerable weight by taking it. A liquid malt extract which recently has been placed upon the market is one made by The Walkerville Brewing Co., of Walkerville, Ont. It has had immense sales already and is very palatable. It contains less than five per cent. of alcohol, and has a silky head on it resembling almost a Guinness' Stout. Analysis shows that it is absolutely pure. It will prove a boon to invalids. The water used in the manufacture of this malt is pure spring water, and the hops those grown by the firm, thus guaranteeing purity and strength. It has received the endorsement of many medical men, and the price is within the reach of all on account of the fact that the bottles used are of Canadian manufacture.
