

Physicians who have used
ALPHOZONE
FOR SUMMER DIARRHOEA

or in any bacterial infections of the alimentary tract, are enthusiastic about its special value and prompt efficiency.

Alphozone is equally as destructive to disease germs as Mercury Bichloride in the same strength solutions, but Alphozone is non-toxic, non-corrosive to the tissues and absolutely safe for internal administration.

Alphozone in tablet form is most convenient to carry ; definite strength solutions can be readily prepared and are immediately active.

Alphozone is invaluable in the treatment of Typhoid Fever in preventing tympanites, reducing the temperature and checking the excessive diarrhoea. Clinical experience in private practise and hospital work conclusively proves this statement.

Sample and literature on request.
